AIM/CGE Modeling: Taiwan

Chin-wen Yang

Ph.D. Candidate, National Central University, Taiwan

Chun-hsu Lin

Ph.D., Associate Research Fellow, CIER, Taiwan

APEIS Workshop, NIES, Tsukuba, Japan, 7~11 November 2005

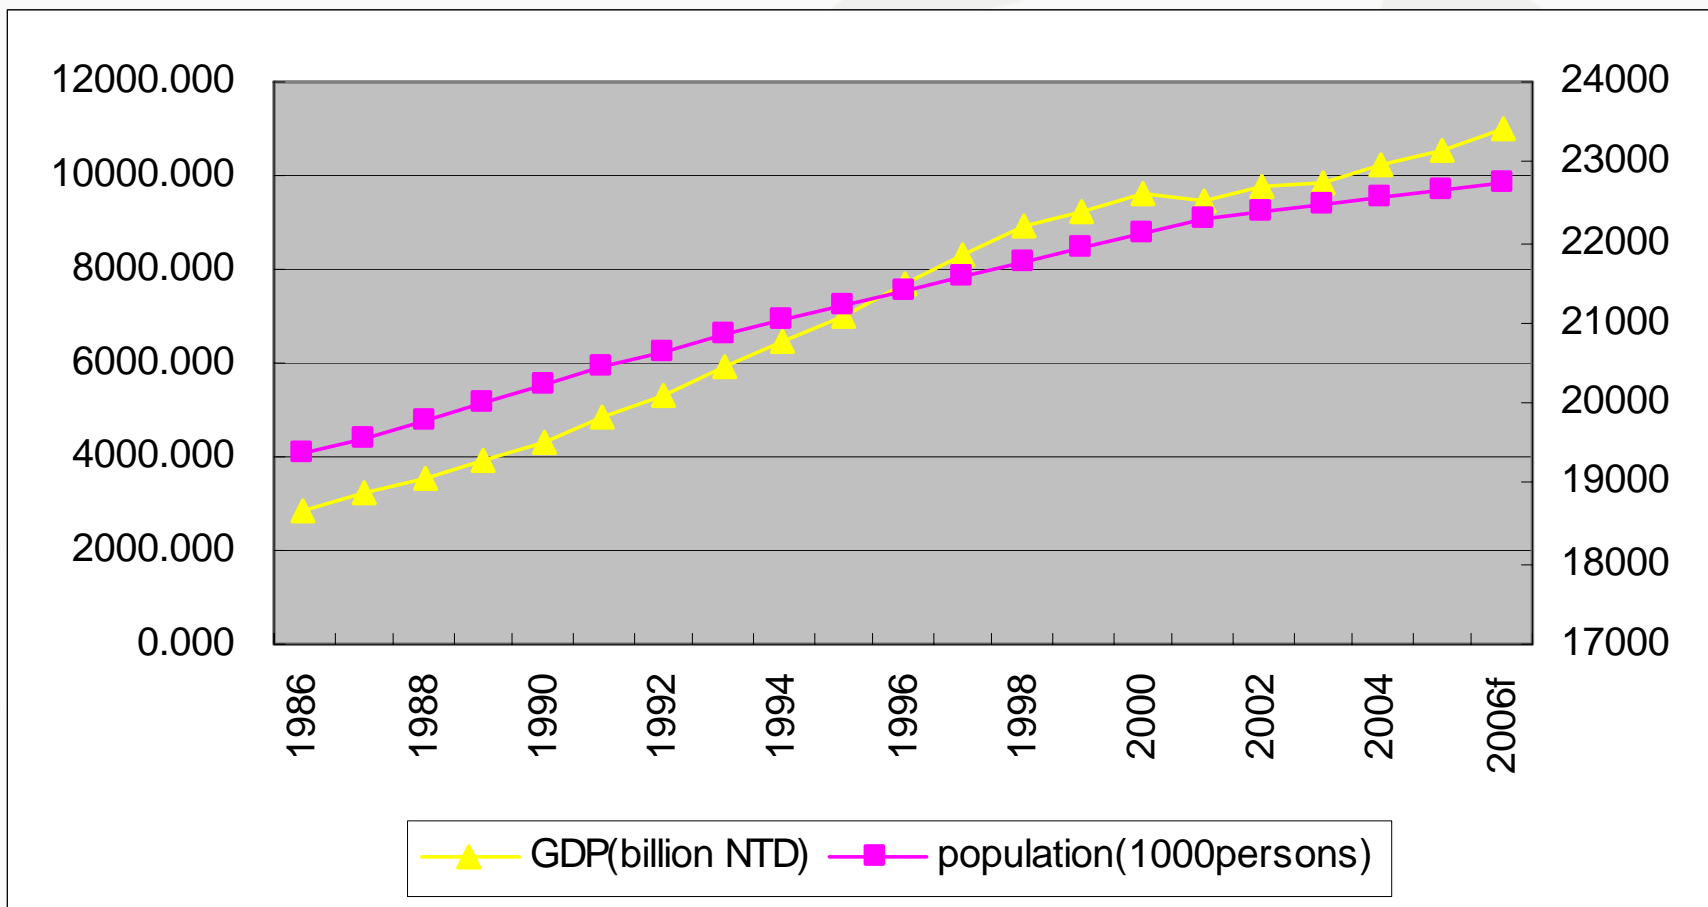

Presentation Outline

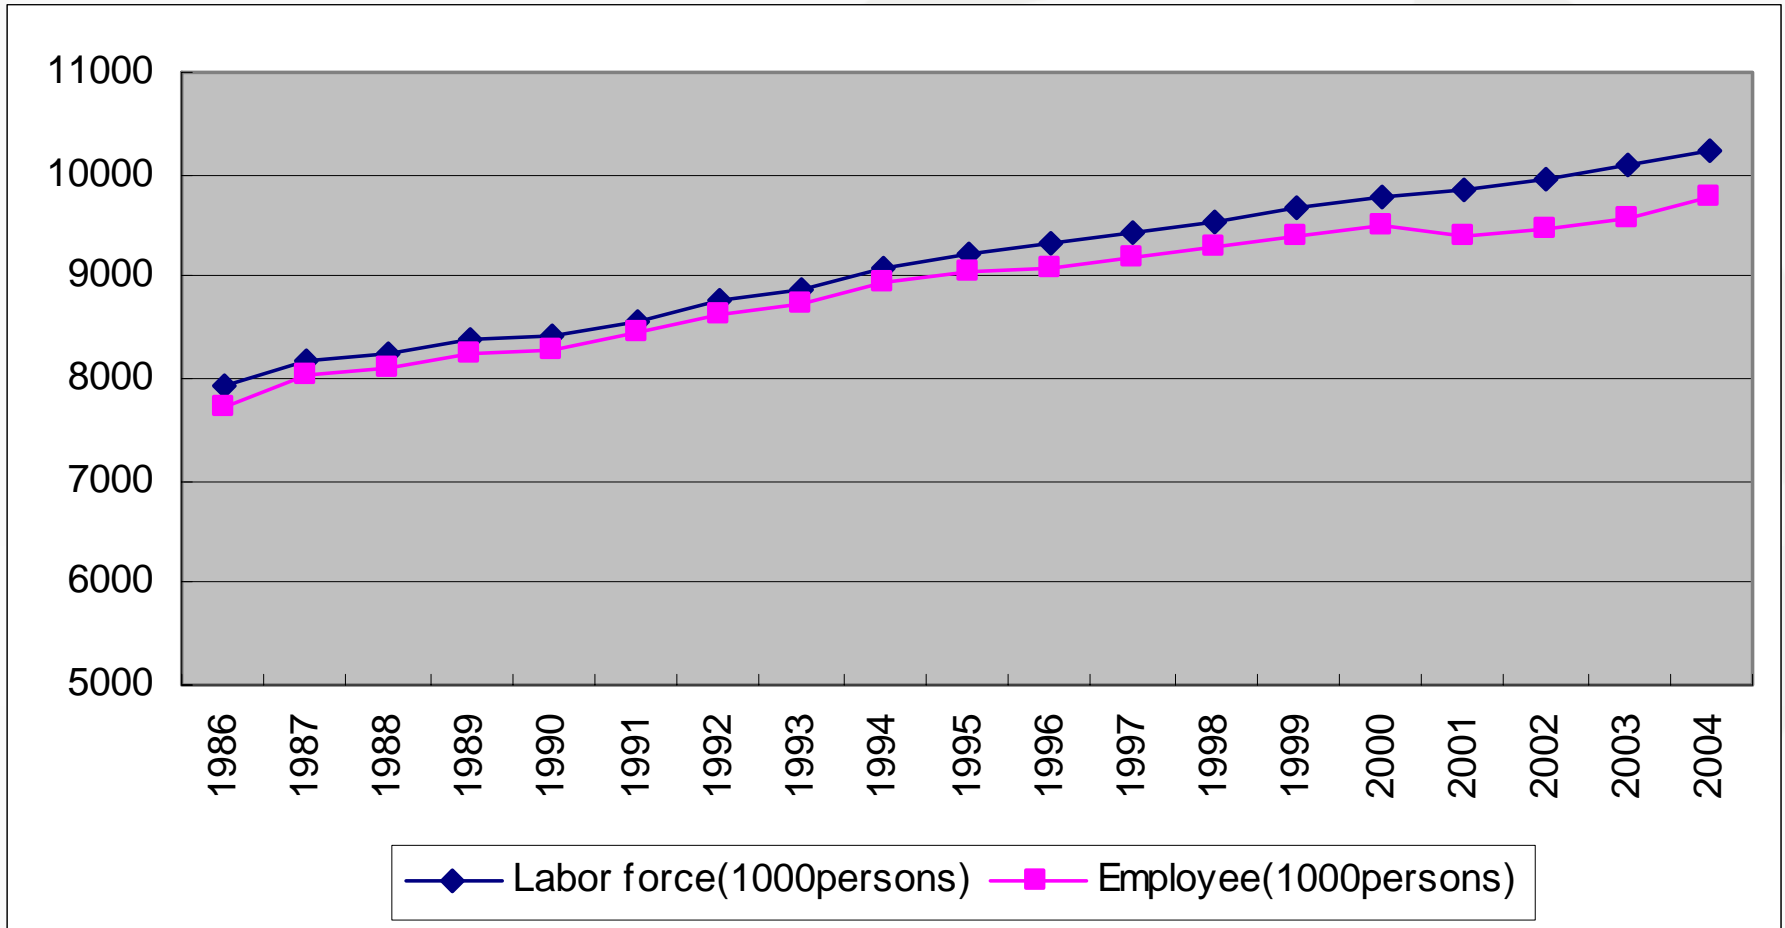

- Basic Information about Taiwan
- Environmental protection proposals
 - Taxation
- Data applied for CO₂ dynamic modeling
- Expected and simulation results
- Conclusions

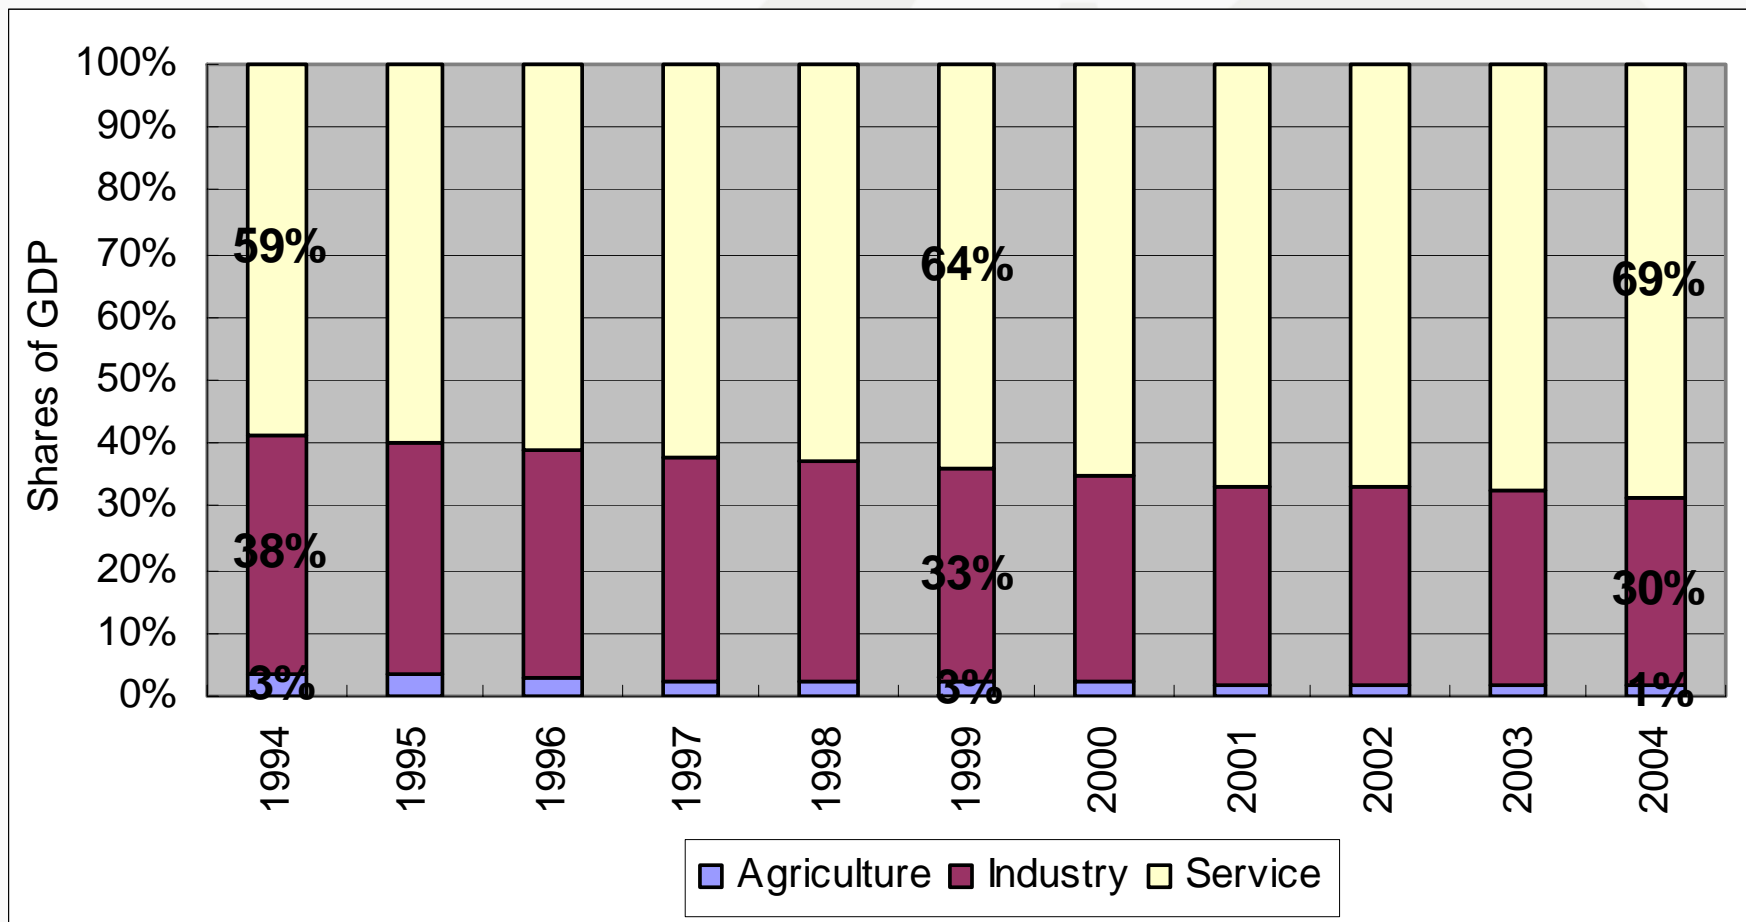

Basic Information

- Population:
 - 23 Million
- GDP:
 - 270 Billion US Dollars (Year 2001)
- CO₂ Emission:
 - 131 261Mtone/year (Year 1990 2004)
 - 22nd largest emission country worldwide
- Large GHG sources:
 - Steel Industry, IT Industry, Transportation

Environmental Protection Proposals

- Environmental Levy (on going)
 - Resource Recycling Fund (for domestic waste)
 - Soil and Ground Water Protection Fund
 - Air Pollution Abatement Fund
 - Water Pollution Abatement Fund (in process)
- Green Tax (under discussion)
 - Based on Sales Quantity
 - Based on Price/Income

Data Applied for Modeling

- Original Data Source:
 - National Statistics Department
- Benchmark Year:
 - 2001 or 1999
- Characteristics of Data:
 - 45x45, 160x160, 596x160 (Commodity x Sector)
- Data for analysis:
 - 62x52 (15 energy commodities)
 - 21x21 (6 energy commodities)

Expected Impacts

- on Economy
 - Lower wages
 - Less household consumption
 - Less manufacturing activities
- on CO₂ emission
 - Higher rate Lower CO₂ emission

Simulation Result (1)

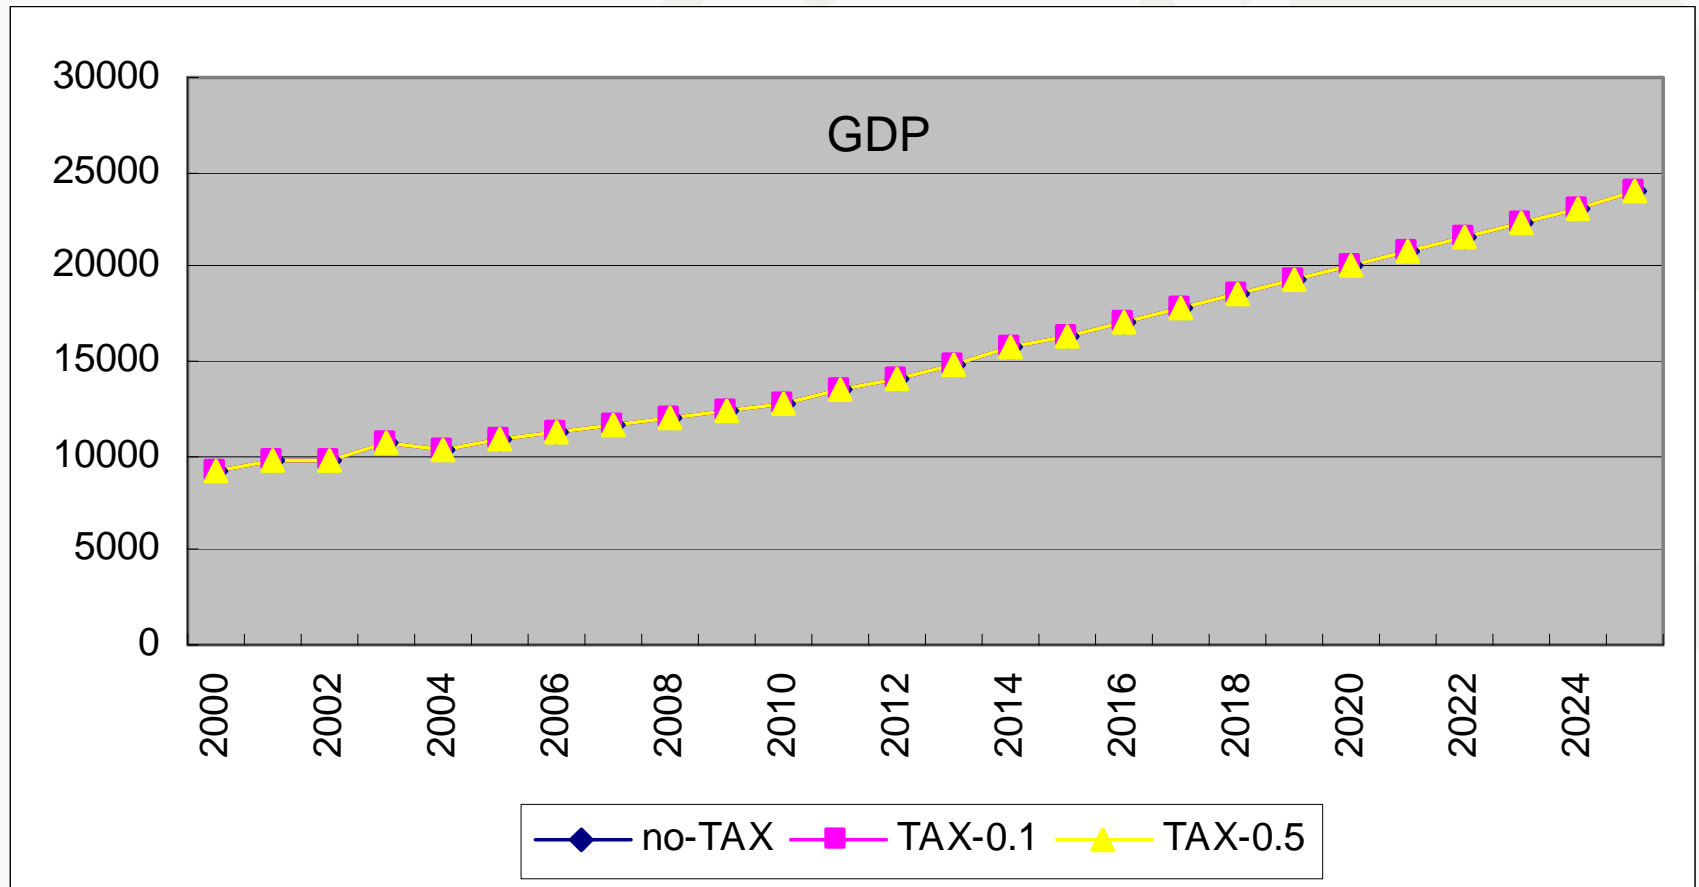

- CO2 emission: no significant impact

Simulation Result (2)

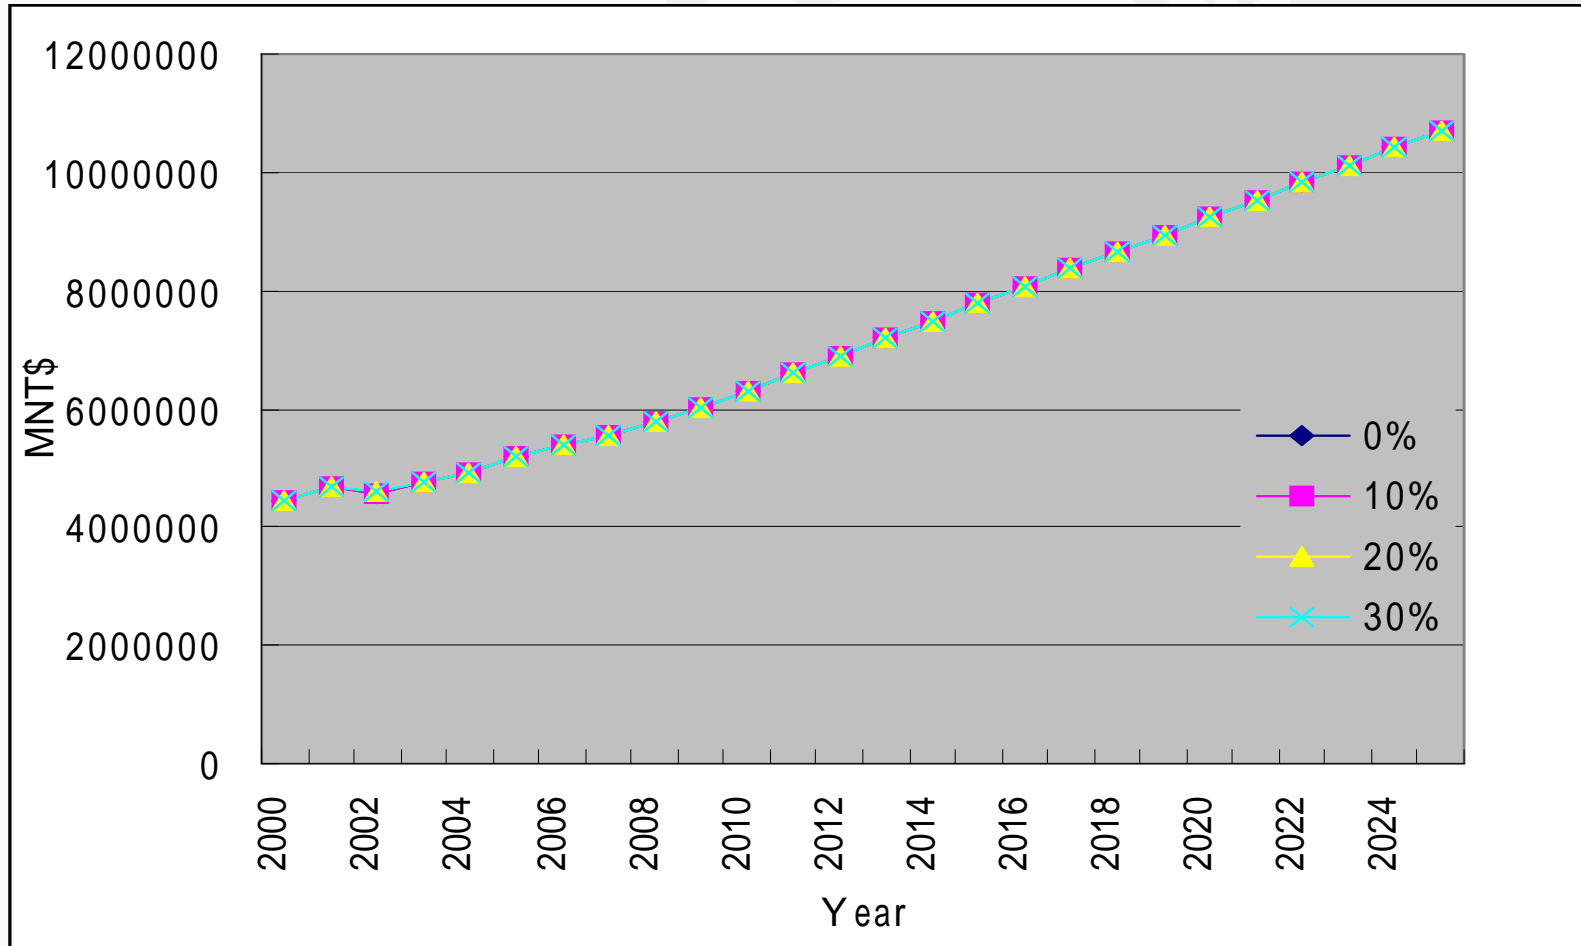

- GDP: no influence

Simulation Result (3)

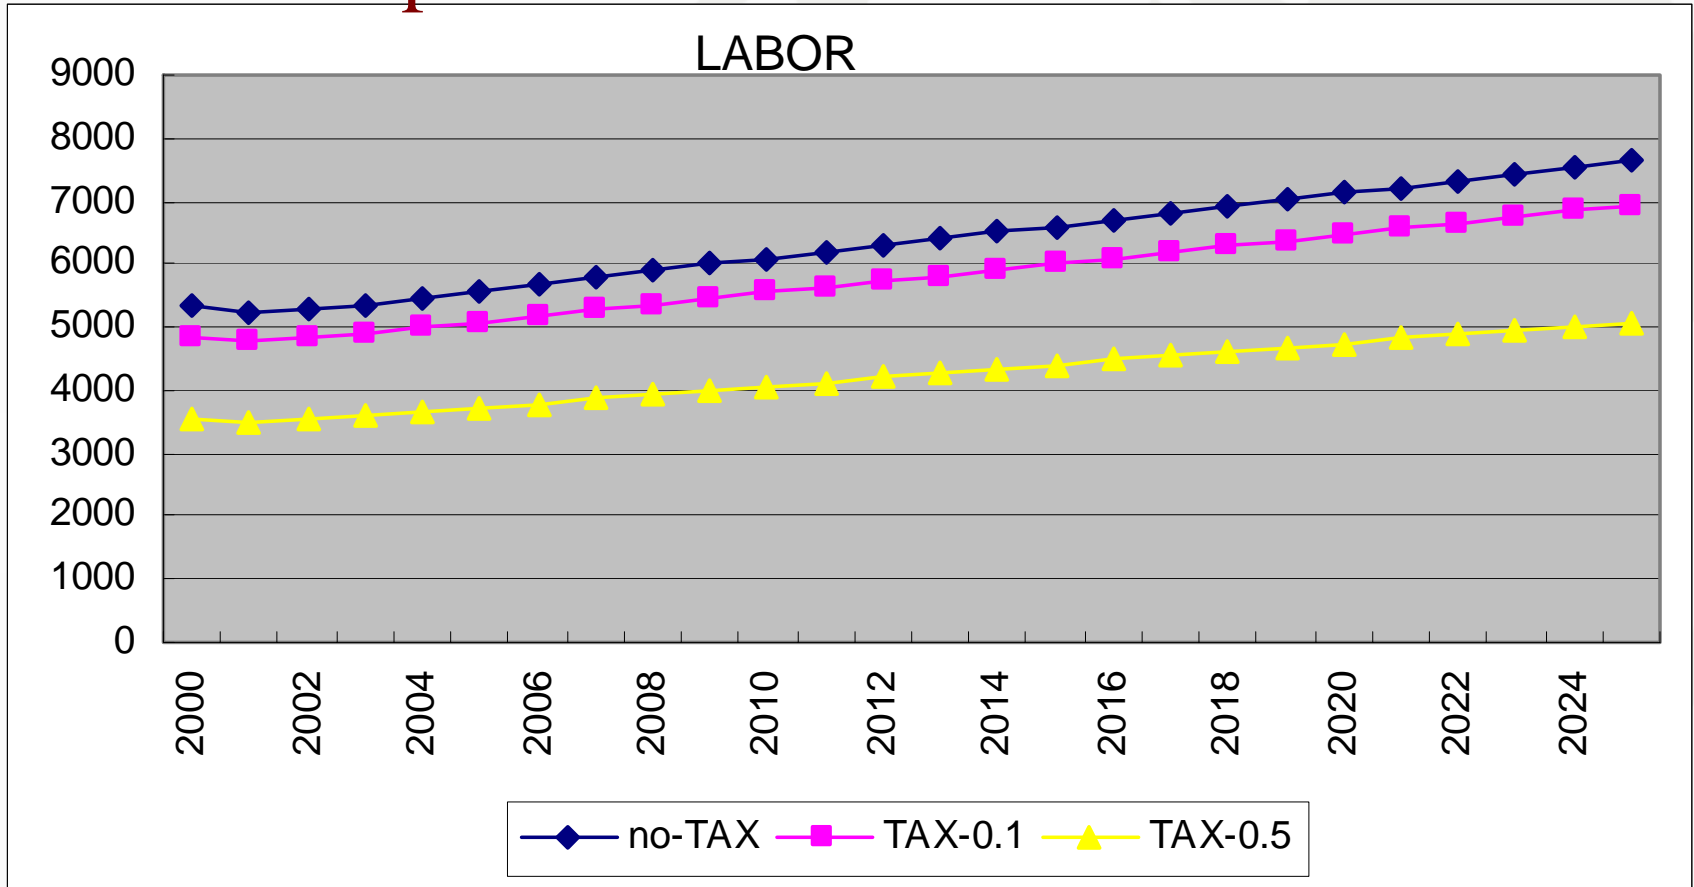

- Total Export: slightly increased

Simulation Result (4)

- Labor: impacts on income

Conclusions

- Re-examine programming
- Income Taxation alone has no effect on CO₂ reduction if no technology improvement
