The background of the slide is a photograph of a misty forest. In the foreground, there is a field of green, leafy plants, possibly a crop field. The trees in the background are shrouded in a light mist or fog, creating a soft, atmospheric effect. The overall color palette is dominated by greens and blues, with the yellow text providing a strong contrast.

# Contribution to Millennium Ecosystem Assessment Overview and simulation results

National Institute for Environmental Studies

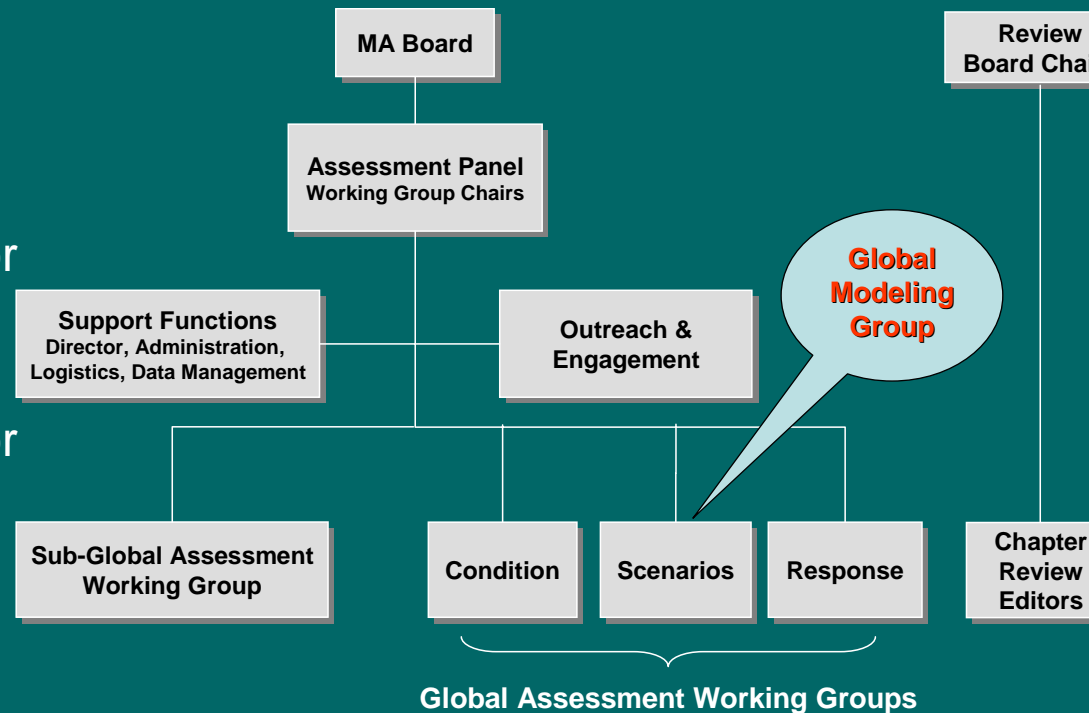

# Millennium Ecosystem Assessment

(<http://www.millenniumassessment.org/en/index.htm>)

- The Millennium Ecosystem Assessment (MA) is an international work program designed to meet the needs of decision makers and the public for scientific information concerning the consequences of ecosystem change for human well-being and options for responding to those changes.

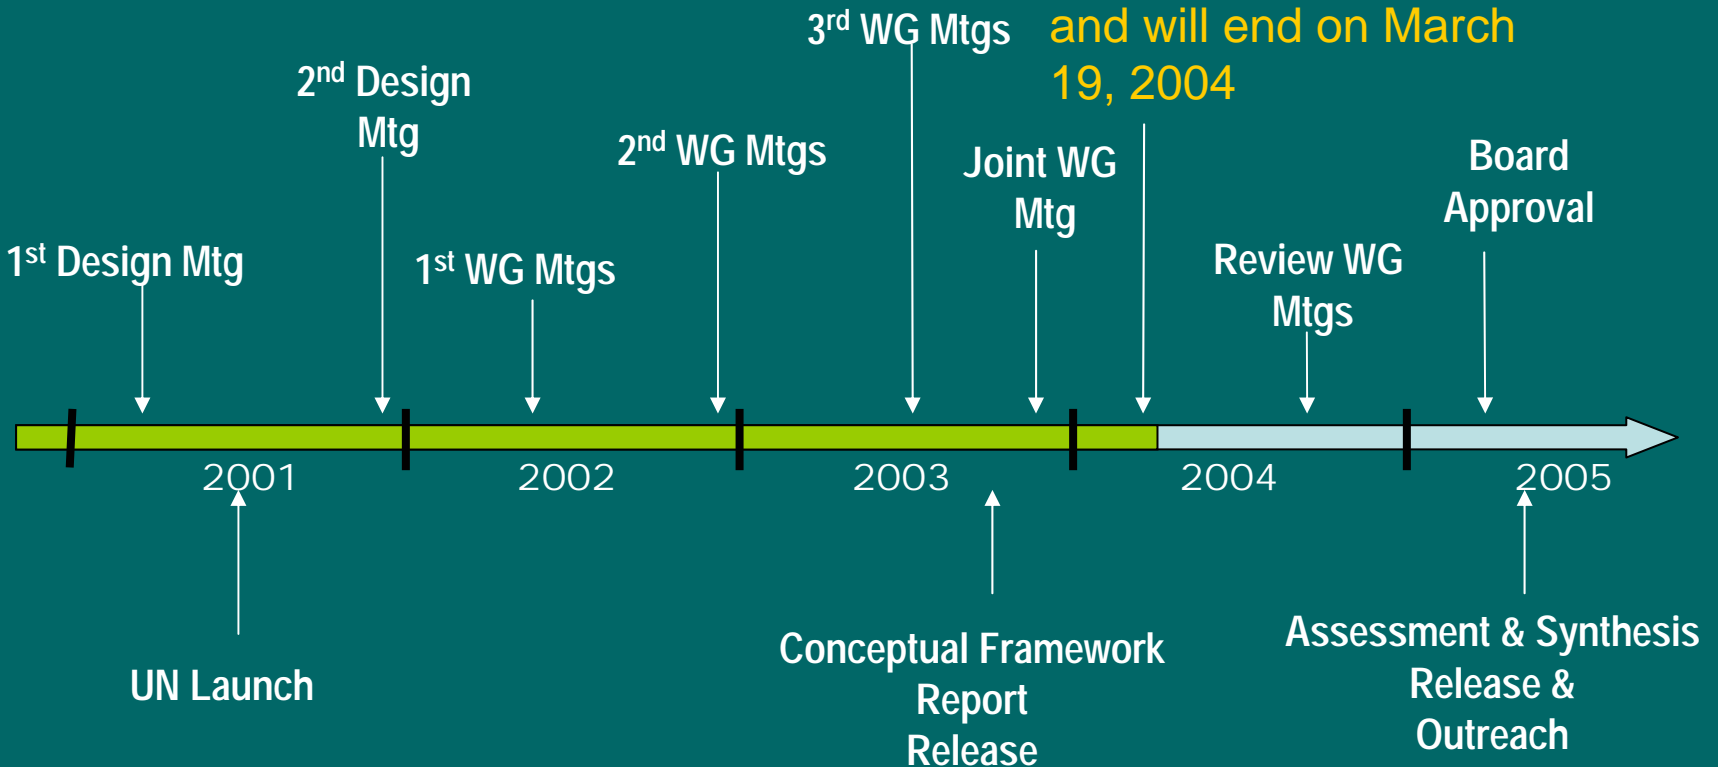

- The MA focuses on:

- ✓ Ecosystem services
- ✓ The consequences of changes in ecosystems for human well being
- ✓ The consequences of changes in ecosystems for other life on earth

# MA Time line of Activities

The first round of peer review for the MA started on January 12 and will end on March 19, 2004

# Contribution to MA

- Contribution to **Chap. 9 of Scenario Assessment**
- Quantification of global long-term scenarios of natural and social environment

- **Harmonization**

- ✓ Driving forces, Climate sensitivity

- **AIM models utilized for MA**

- ✓ AIM/Water

- Country-wise water-use (withdrawal and consumption), Country-wise renewable water resource, Spatial distribution of water-use and renewable water resources, Basin-wise water stress index

- ✓ AIM/Agriculture

- Potential crop productivity of Rice, Wheat and Maize

- ✓ AIM/Ecosystem

- SO<sub>x</sub>, NO<sub>x</sub>, Land use change, Biomass energy

- **Uncertainty Analysis**

# Scenarios of MA

## MA Scenarios

## Related SRES

- Global Orchestration (GO) A1
- Techno Garden (TG) B1+550
- Order from Strength (OS) A2
- Adapting Mosaic (AM) A2 → B2

# Direct/Indirect Drivers and Ecosystem Services of MA Scenarios

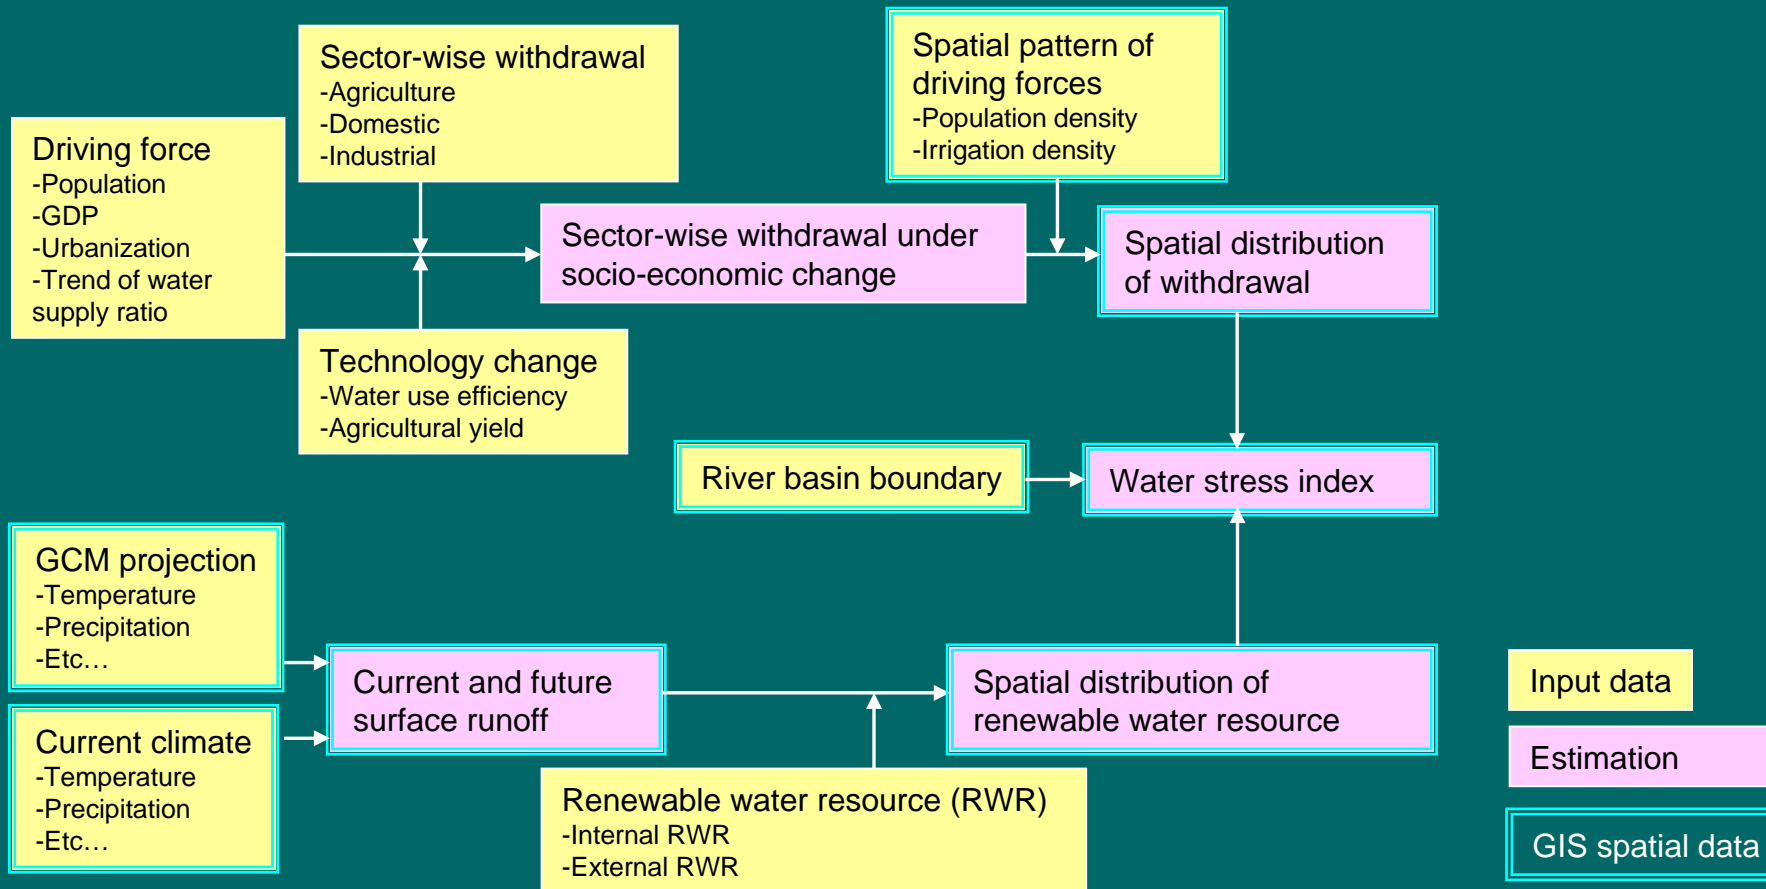

- Indirect drivers: population, technology, income, ....
- Direct drivers: Energy, Emissions, Climate change, Land use, Urbanization, ...
- Ecosystem services: Food, Fuel, Freshwater, Water supply, Air quality, ...
- ◆ Inputs from AIM team: rice, wheat, maize productivity change / freshwater availability, withdrawal, consumption / water stress index / urban population rate / NO<sub>x</sub> and SO<sub>x</sub> emissions / biofuel

# Regional Classification of MA

MA region	AIM/Ecosystem region
<b>OECD-Regions</b>	Canada / United States / Japan / Oceania / OECD Europe / Eastern Europe
Canada / United States / Japan / Oceania / OECD Europe / Eastern Europe + Baltic Countries	
<b>FSU not including Eastern Europe</b>	Former Soviet Union
Belaruss _Ukraine_Moldava / Rest of FSU	
<b>MENA</b>	Northern Africa / Middle East
Northern Africa / Middle East	
<b>Subsaharian Africa</b>	Subsaharian Africa
Eastern Africa / Southern Africa / Western Africa	
<b>Latin America</b>	Latin America
Central America / South America	
<b>Asia (without Middle East)</b>	East Asia / South Asia / South East Asia
East Asia / South Asia / South East Asia	
	Rest of the world

# AIM/Water model

- Country-wise water-use (withdrawal and consumption)
- Country-wise renewable water resource
- Spatial distribution of water-use and water resource
- Water stress index in each river basin

# Sector-wise water withdrawal

OECD

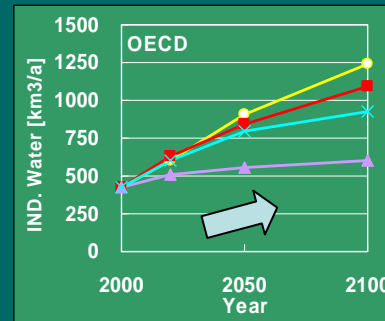

Agriculture

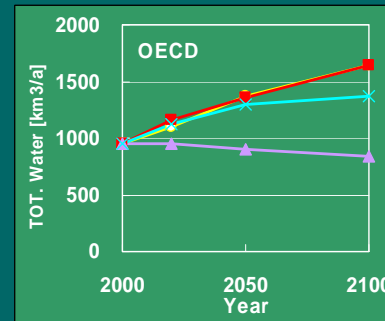

Domestic

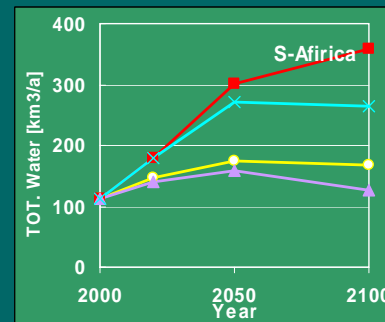

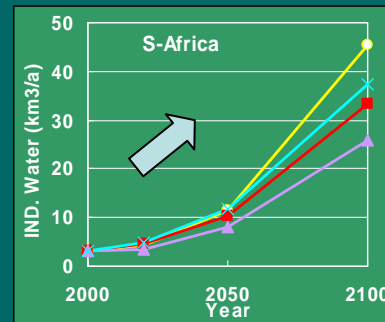

Industry

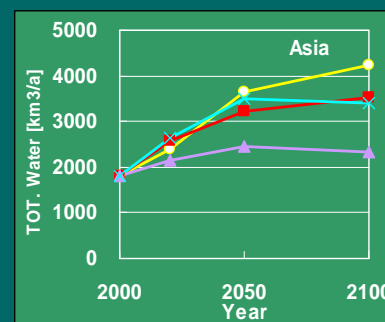

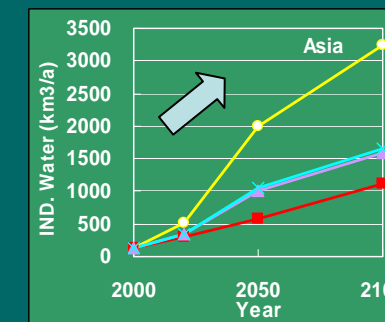

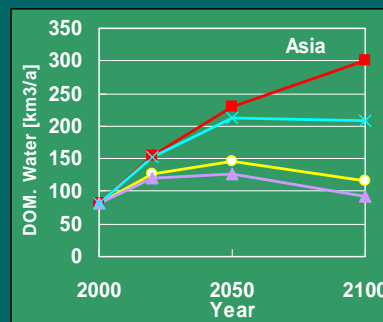

Total

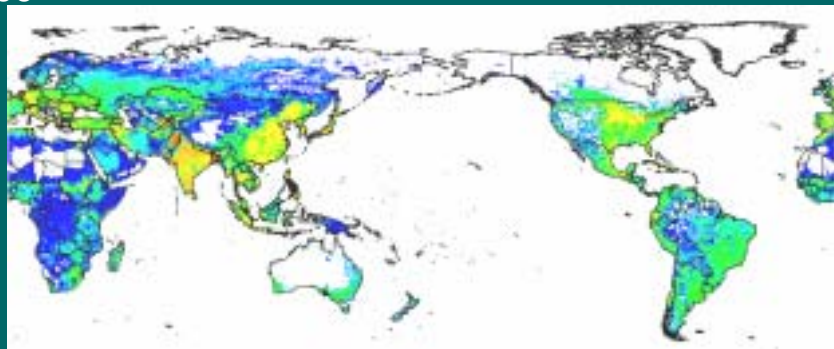

Africa

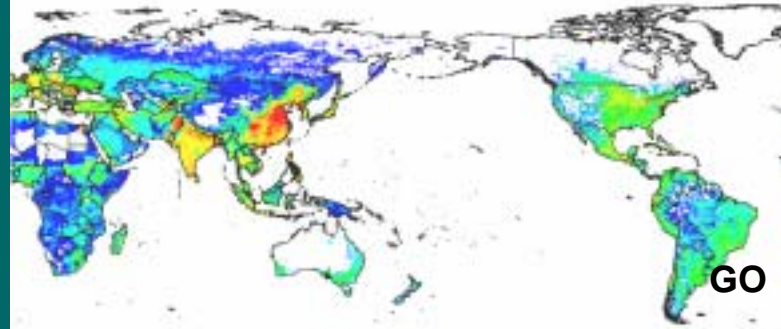

Asia

2000

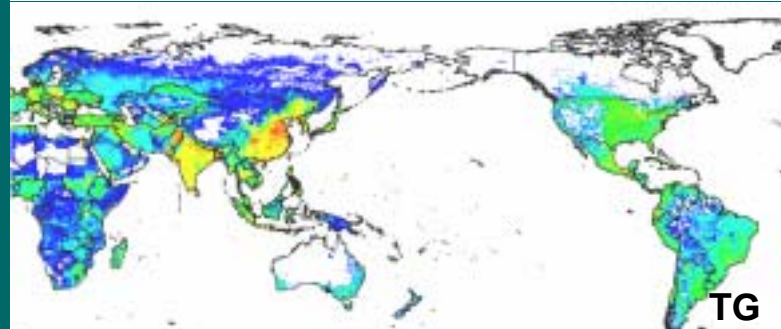

2100

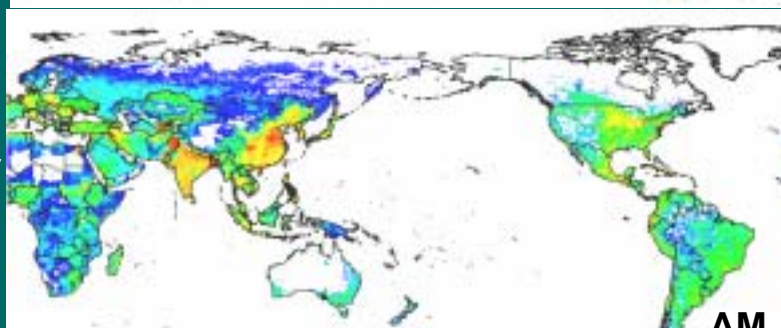

GO

OS

TG

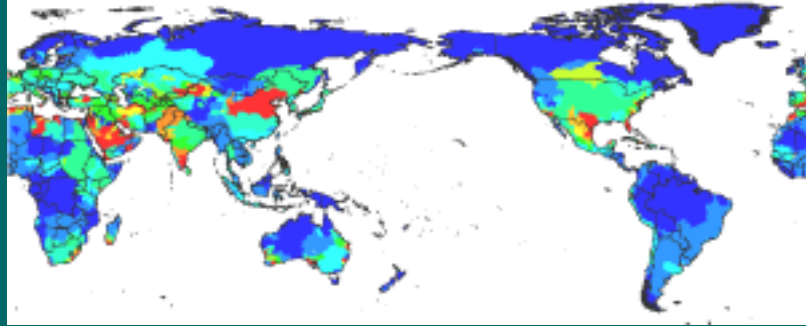

AM

**Water withdrawal per unit area in 2000 and 2100**

- Developing countries:** Water demand density will increase especially under GO and OS.
- China & East Europe:** Water demand increase under GO because of quite high economic growth rate.
- Africa, Middle East & South Asia:** Water demand increase under OS because of quite high population growth rate.

**Water Withdrawal (total)**

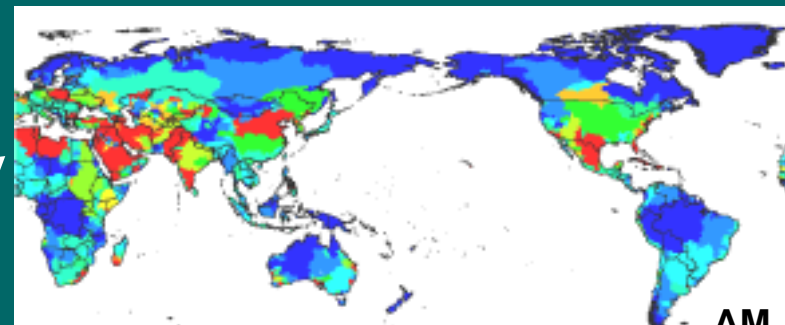

GO

OS

TG

AM

-In general, the order of stress is OS > AM > GO > TG  
 Withdrawal: driven by socio-economic factors  
 Water resource: driven by climate factors  
 General trend of stress index change can be explained by demand side.

**-ME and N. Africa**

High drought risk ← water demand increase derived from population increase and economic development.  
 Mitigated in TG ← high efficiency of water use.

**-East Europe**

High draught risk in GO ← high rate increase of industrial water withdrawal which cannot be compensated with the water use efficiency improvement.

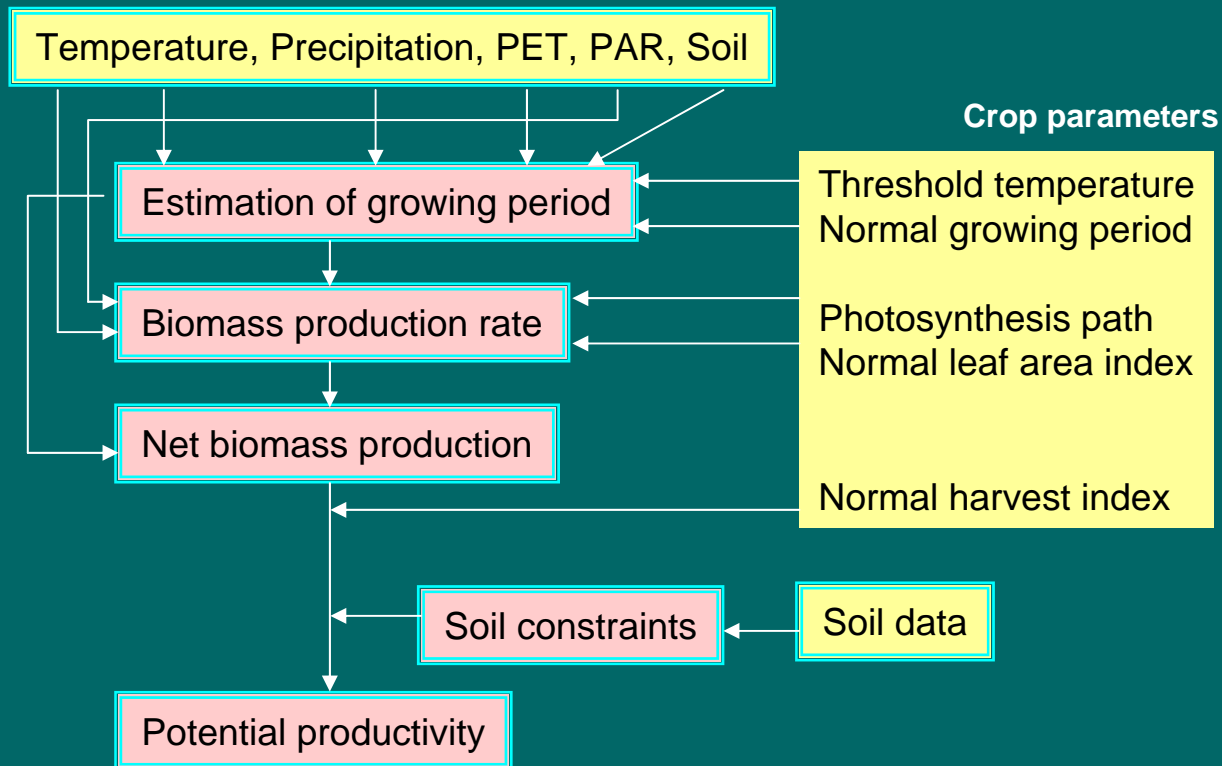

**Water Stress Index**  
 ratio between total withdrawal  
 and renewable water resource)

# AIM/Agriculture model

## ✓ Spatial estimation of potential crop productivity

0.5° x 0.5° spatial resolution

Rice, Wheat, Maize, and other 9 crops

Input data

Estimation

GIS spatial data

# Simulation Results (Potential crop productivity)

Wheat

Maize

**-Generally**, the degree of potential productivity change coincides with the speed of temperature increase; OS > GO > AM > TG. Potential productivity will increase in high-latitude regions, and decrease in low-latitude regions. In mid-latitude regions, effect of climate change depends on the variety of crops.

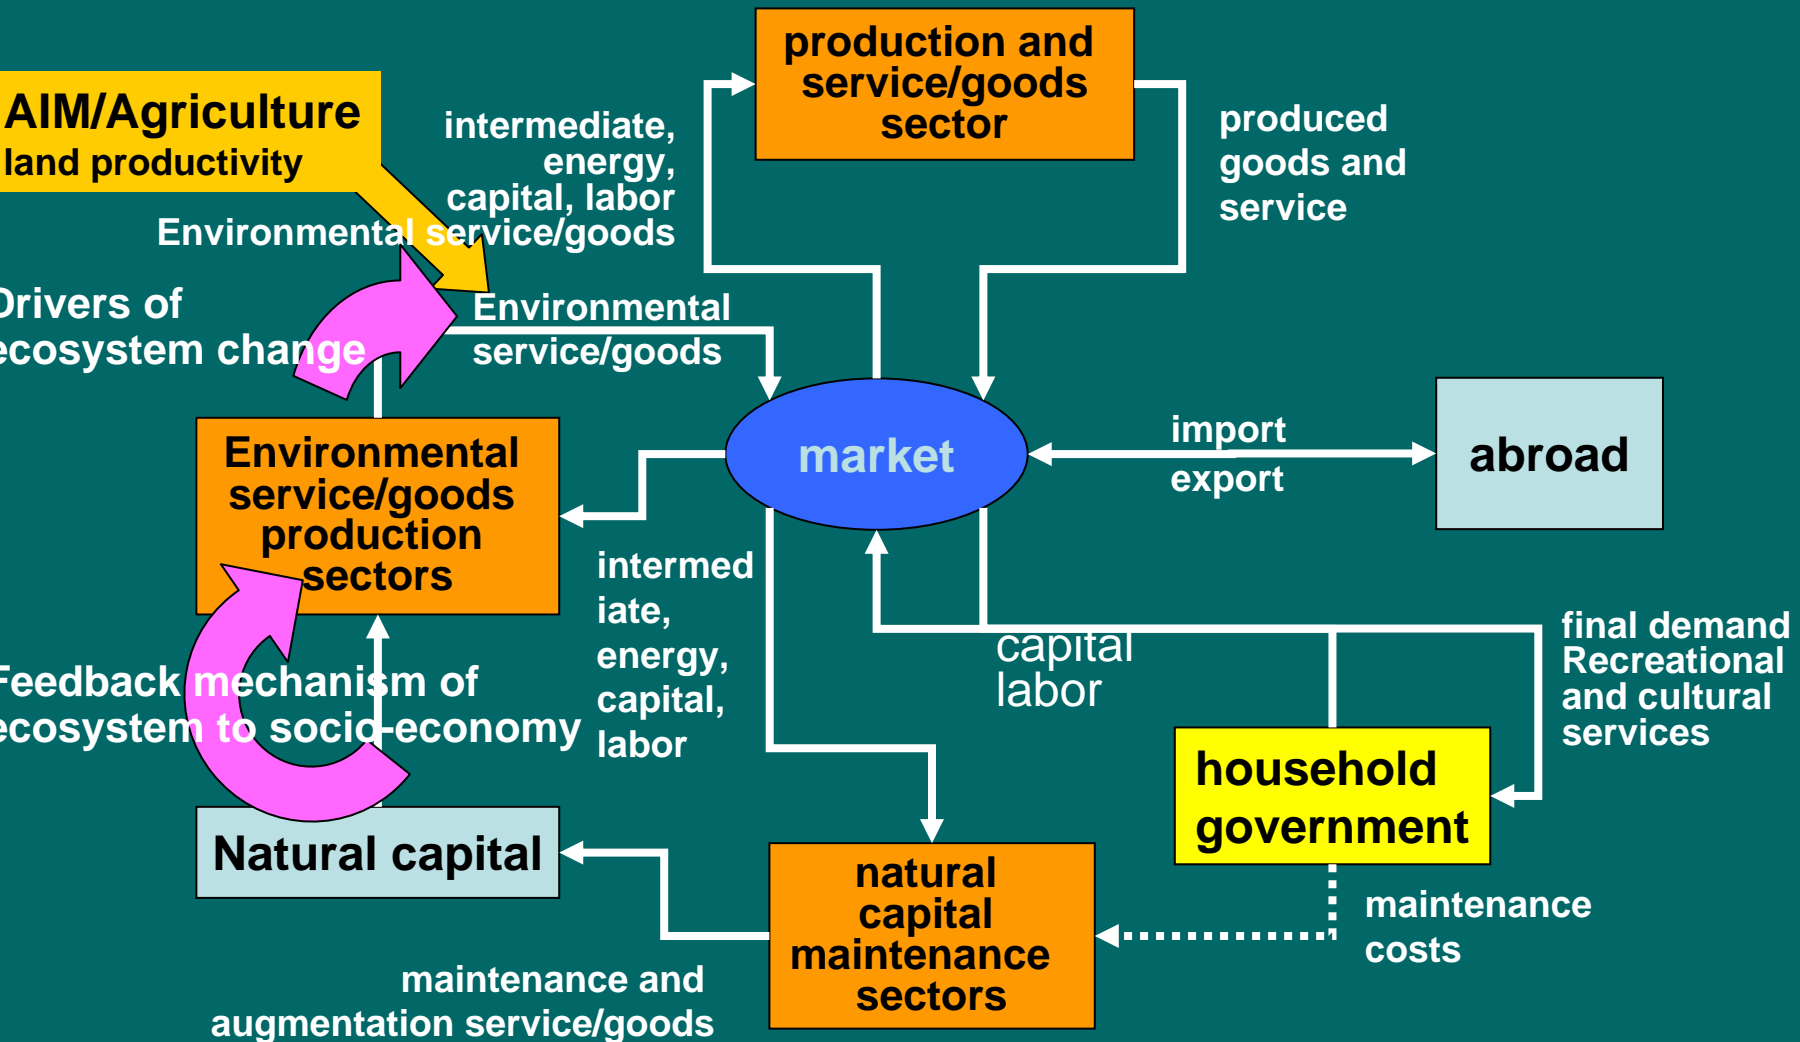

**-FSU**: productivities of wheat and maize increase very rapidly by global warming under any scenarios.

**-Latin America**: As global warming progresses, the potential productivity will decrease.

**-OECD**: the potential productivity of wheat will decrease, while that of maize will increase because of global warming. Generally, the most suitable temperature for maize growth is higher than that for

# Structure of AIM/Ecosystem

Based on CGE model supported by other AIM models

# Simulation Results (SOx)

SOx Emission = Potential SOx generation – SOx Reduction

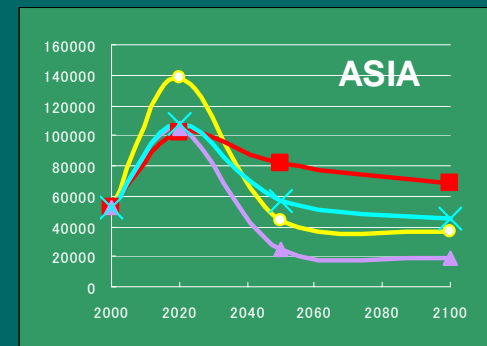

Energy use  
Land use & LU change

Investment of SOx red. equipment  
SOx reduction efficiency

Economic growth  
Population

Results from AIM/Ecosystem

Scenarios

Regional SOx emissions results (MtSO2)

GO OS TG AM

# Simulation Results (NOx)

$$\text{NOx Emission} = \text{Potential NOx generation} - \text{NOx Reduction}$$

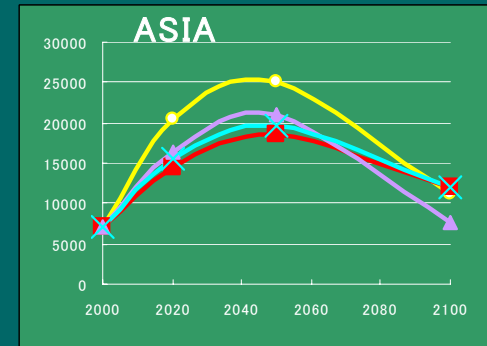

Energy use  
Land use & LU change

Investment of NOx red. equipment  
NOx reduction efficiency

Economic growth  
Population

Results from AIM/Ecosystem

Scenarios

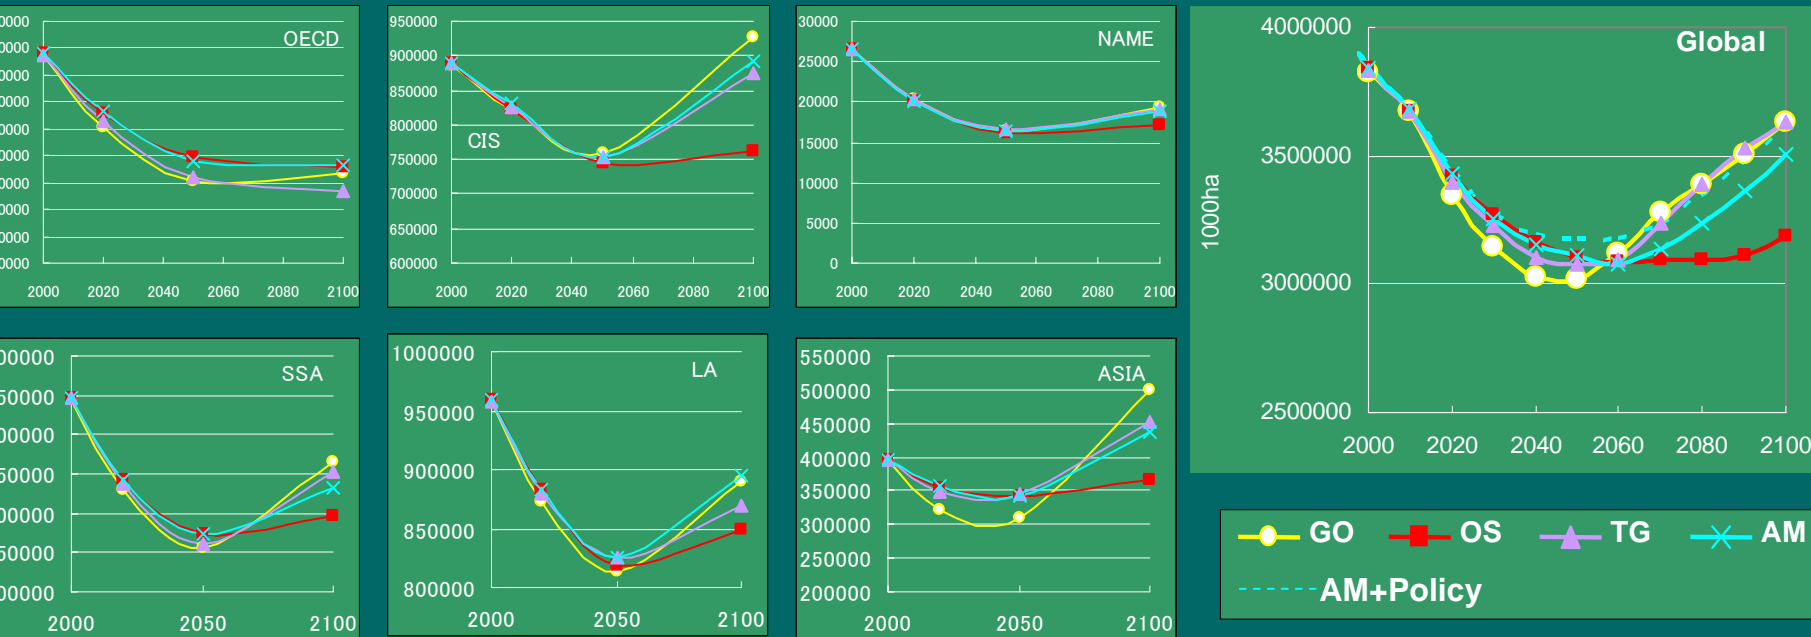

Regional NOx emissions results (MtN)

# Simulation Results (Forest area)

In any scenario, forest area decrease at the beginning of 21st century.

Pressure from other land use; agriculture, pasture & biomass plantation

GO: Pressure from meat demand & plantation biomass

OS & AM: Pressure from general food demand

Pressure from globalization; GO & TG

In 2nd half of 21st century, forest area is recovered.

Effects of technologies: TG & GO

Pressure from population: OS

Forest protection policy in AM will recover the forest area at the same level of those in TG and GO.

# Messages from simulations

1. **Till the middle of 21st century, the pressure on the ecosystem would continue**
2. **Globalization (rapid economic growth) scenarios will damage ecosystem**
3. **Population growth would prevent ecosystem from recovering**
4. **Technology improvement will help recovery of ecosystem**
5. **Specific policies would be necessary to maintain ecosystem**
