- ▶ Background
- ▶ Methodology
- ▶ Results
- ▶ Policy implications
- ▶ Conclusion

# Background

---

## ▶ ADB's project

- ▶ which is named, “Economics of Climate Change and Low Carbon Growth Strategies in Northeast Asia”.
- ▶ ADB’s website says “one of the objectives of the project is to contribute to the regional and national debate on the economic costs and benefits of the actions on climate change mitigation”.

## ▶ Mission

- ▶ Projecting abatement cost curves for China, Japan, Korea, and Mongolia.
- ▶ Projecting GHG emissions and mitigations for these four countries.
  - ▶ The following results are the preliminary findings for the ADB study.

# Background

---

## ▶ Outcomes

- ▶ GHG emissions and mitigations in 2020/30
- ▶ Abatement cost curves in 2020/30

## ▶ Calculation tool

- ▶ AIM/Enduse ACC tool
  - ▶ Bottom-up modeling tool
    - Detail technology selection framework
  - ▶ Static analysis
    - Mitigation options under a certain carbon price are selected

# Methodology

## ▶ Key factor of the abatement cost curve analysis

- Abatement cost curves provide technological mitigation potentials and technological implementation costs in each region.
- Be careful that abatement cost curves vary depending on the setting of:
  - future energy price
  - technology data (technology costs, discount rate, payback periods, etc)
  - baseline scenario (socio-economic settings and energy service demand)

# Methodology

---

## ▶ Data collection

- ▶ Activity amount (= driving force)
  - ▶ Driving forces collected by consultants and researchers from four countries are used for our projection.
- ▶ Mitigation option (= technology)
  - ▶ 200 or more options are prepared.

## ▶ Simulation cases

- ▶ Baseline case:
  - ▶ Technology frozen case
- ▶ Scenarios:
  - ▶ Carbon price: 50, 100, 200 USD/tCO<sub>2</sub>
  - ▶ Payback period: Short, Long

## ▶ Time horizon

- ▶ Base year: 2008, Target year: 2020/30

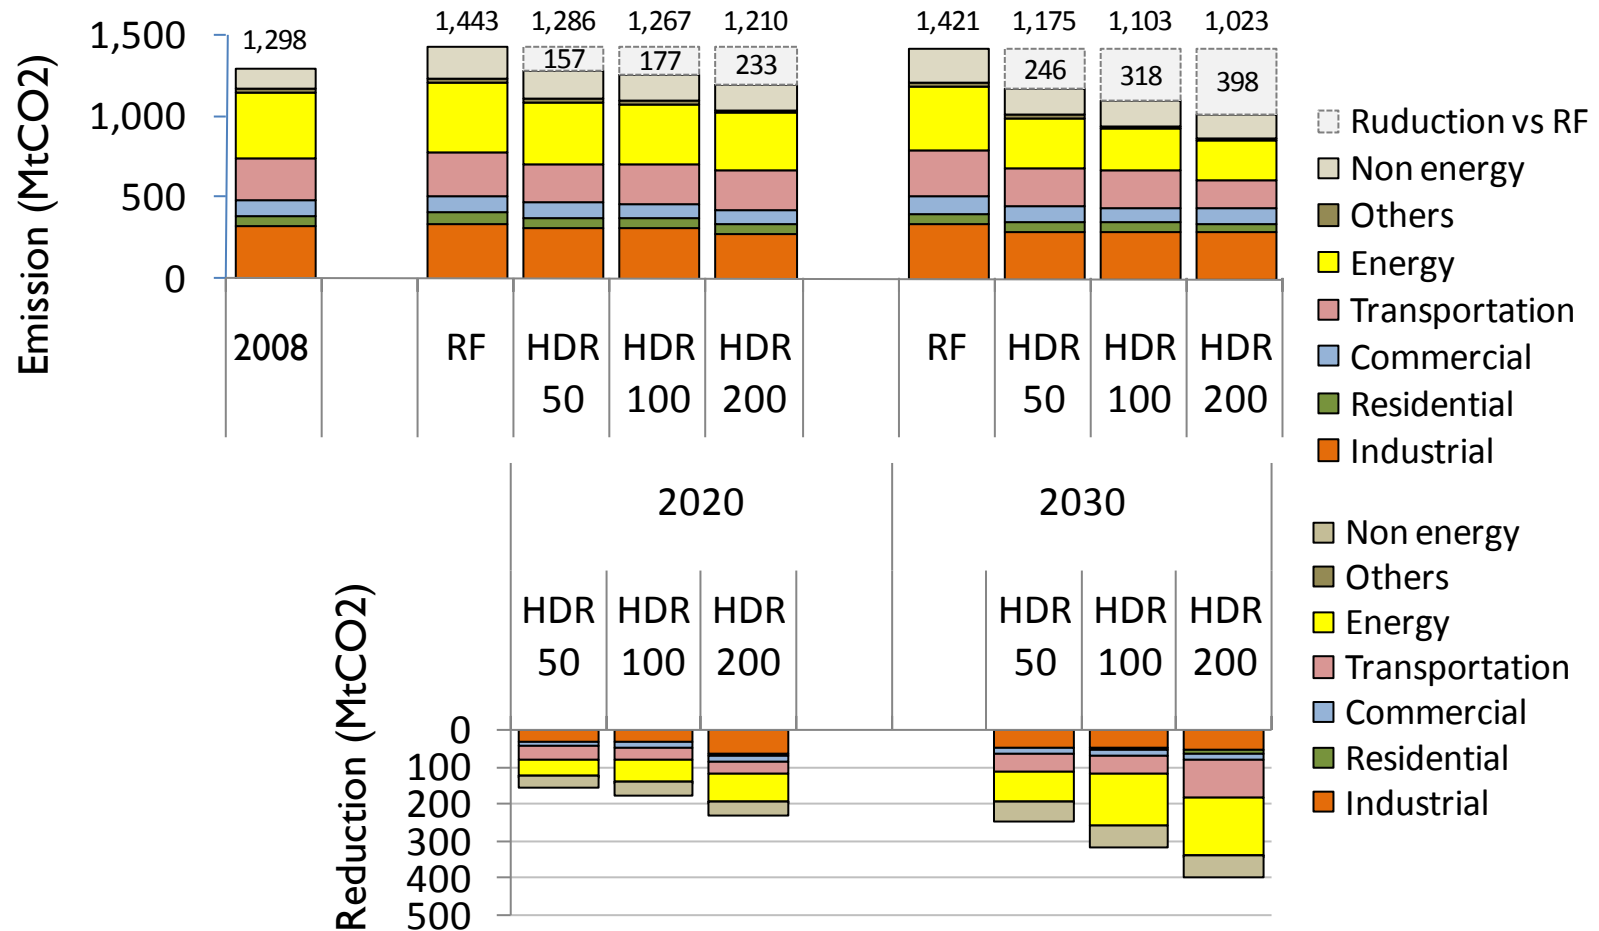

# Japan

## Activity amount

Sector	Indicator	Unit	Base year	Target year	
			2008	2020	2030
Industry					
Iron & Steel	Production	Million tons	106	120	120
Cement	Production	Million tons	66	67	66
Others	Industrial Production Index	2008 = 100	100	100	101
Residential	No. of Households	Million HHs	52	54	52
Commercial	Floor Space	Million m2	1,817	1,932	1,920
Transportation					
Passenger	Traffic Volume	Billion p-kms	1,292	1,307	1,304
Freight	Change in Traffic Volume	2008 = 100	100	114	114
Agriculture					
Livestock	Livestock	1000 heads	4,420	4,280	4,280
Crops	Cultivation Area	1000 ha	4,270	4,950	4,950

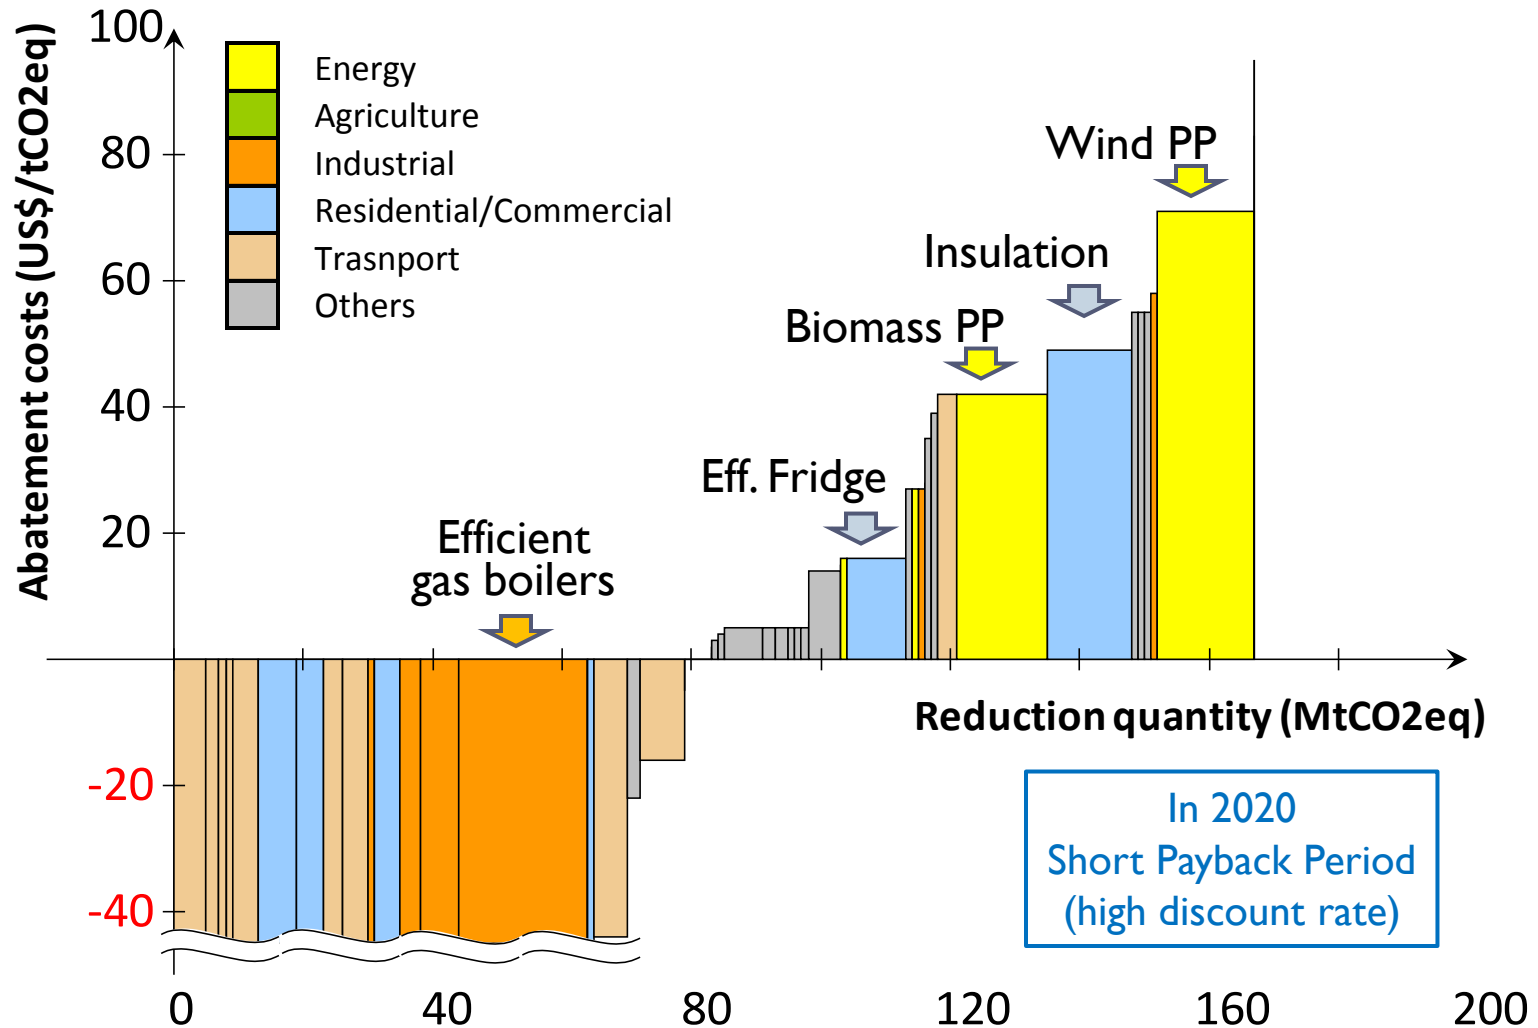

# Japan

## GHG Emission/Mitigation Potential

# Japan Abatement Cost Curve

# Korea

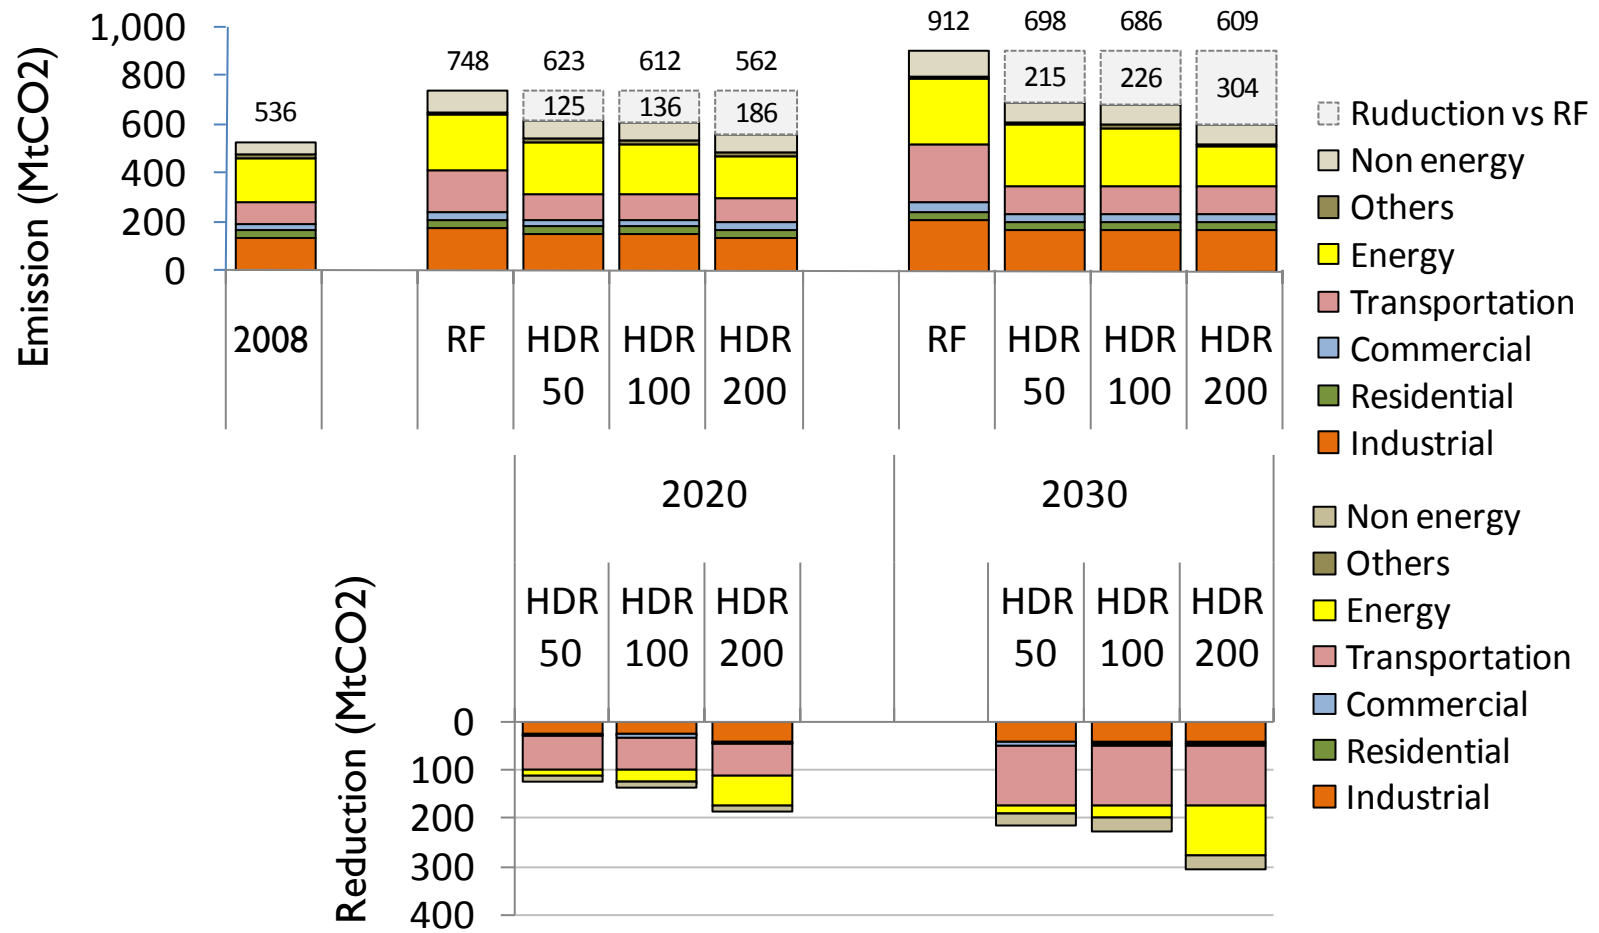

## Activity amount

Sector	Indicator	Unit	Base year		Target year	
			2008	2020	2030	
Industry						
Iron & Steel	Production	Million tons	56	74	88	
Cement	Production	Million tons	53	70	83	
Others	Change in GDP	2008 = 100	100	131	155	
Residential	Population	2008 = 100	48	50	50	
Commercial	Change in GDP	2008 = 100	100	131	156	
Transportation						
Passenger	Traffic Volume	Billion p-km	332	393	445	
Freight	Traffic Volume	Billion t-km	171	426	639	
Agriculture						
Livestock	Number of Livestock	Million heads	615	593	595	
Crops	Cultivation Area	1000 ha	1,210	1,248	1,267	

# Korea

## GHG Emission/Mitigation Potential

# Korea

## Abatement Cost Curve

# China

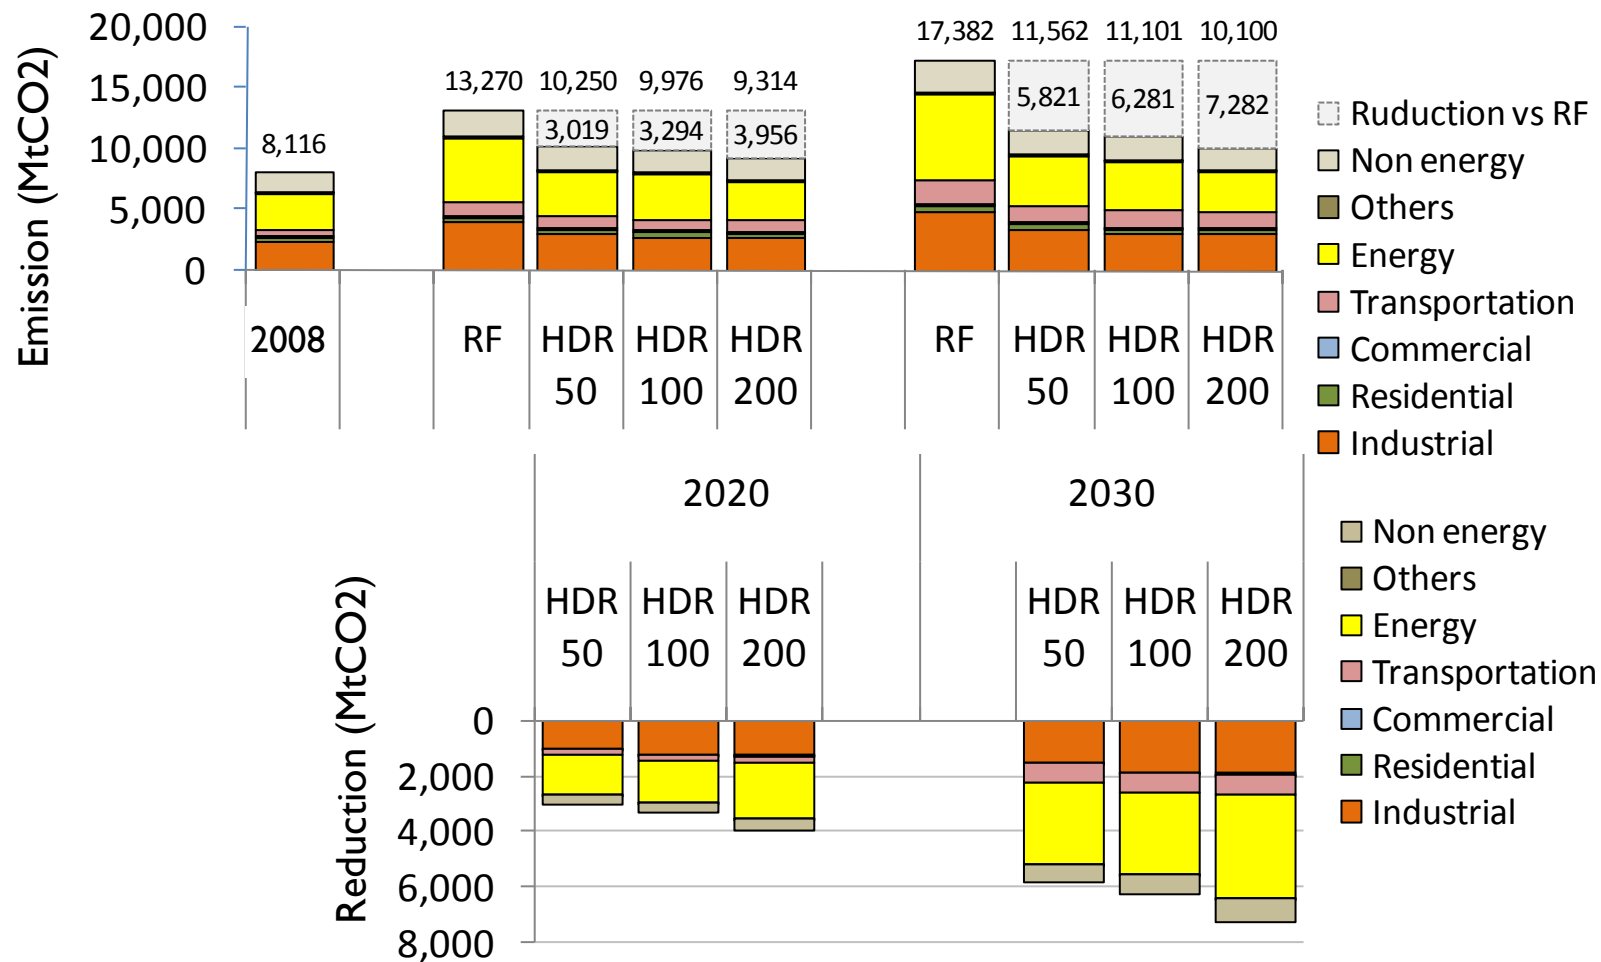

## Activity amount

Sector	Indicator	Unit	Base year	Target year	
			2008	2020	2030
<b>Industry</b>					
Iron & Steel	Production	Million tons	406	610	570
Cement	Production	Million tons	1,168	1,600	1,600
Others	Change in Secondary Industry GDP	2008 = 100	100	213	340
Residential	Population	Million ps	1,329	1,388	1,394
Commercial	Change in energy service demand	2008 = 100	100	122	141
<b>Transportation</b>					
Passenger	Traffic volume	Billion p-km	2,571	4,999	8,033
Freight	Traffic volume	Billion t-km	3,224	6,188	9,357
<b>Agriculture</b>					
Livestock	Number of Livestock	Million head	10,544	12,884	14,520
Crops	Cultivation Area	Million ha	123	151	170

# Mongolia

## GHG Emission/Mitigation Potential

# Mongolia

## Abatement Cost Curve

# Policy implications

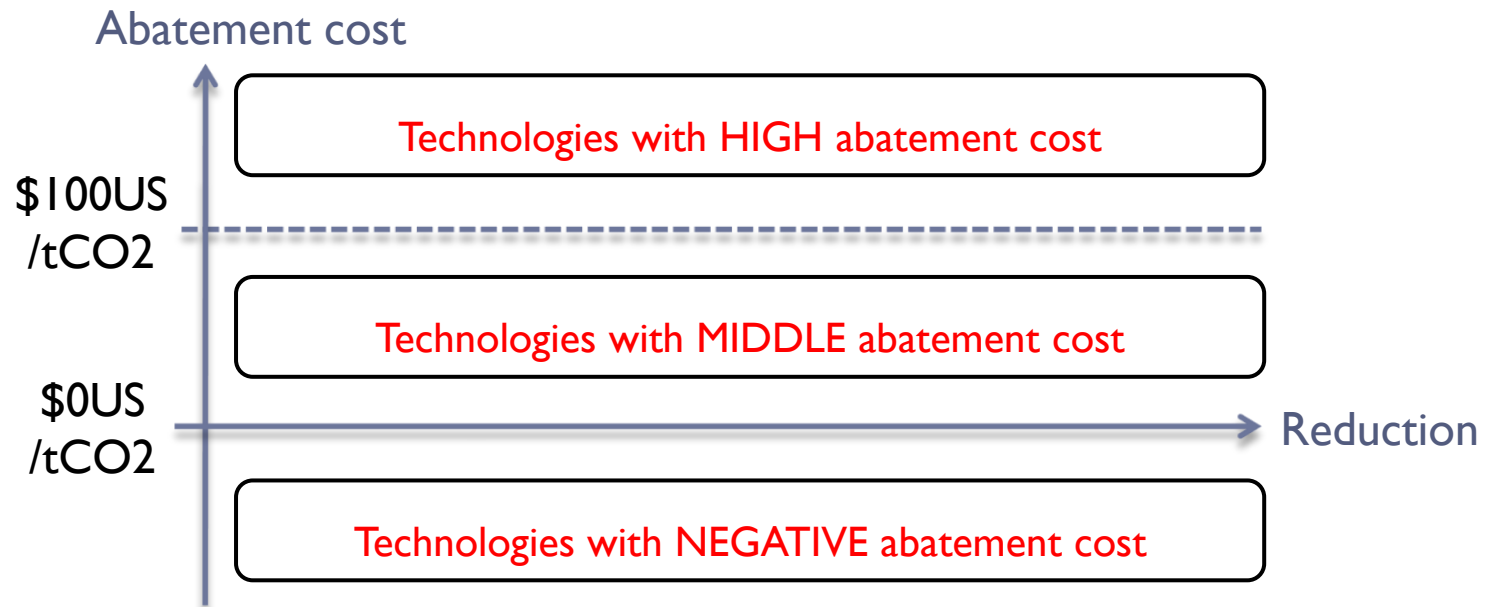

---

- ▶ (1) Effective policy varies for the type of technologies
  - ▶ Mitigation options are divided by abatement cost into some groups. The effective policy/action varies for each group.
- ▶ (2) Payback period has a large impact
  - ▶ Only in Japan were there major changes in reduction potential depending on the payback period.
- ▶ (3) Measures for climate change enhance the stability of energy supply
  - ▶ Especially in China, coal consumption increases tremendously without actions for climate change. On the other hand, in the event that actions are taken, coal consumption increase could be held to a small amount.

# Policy implications

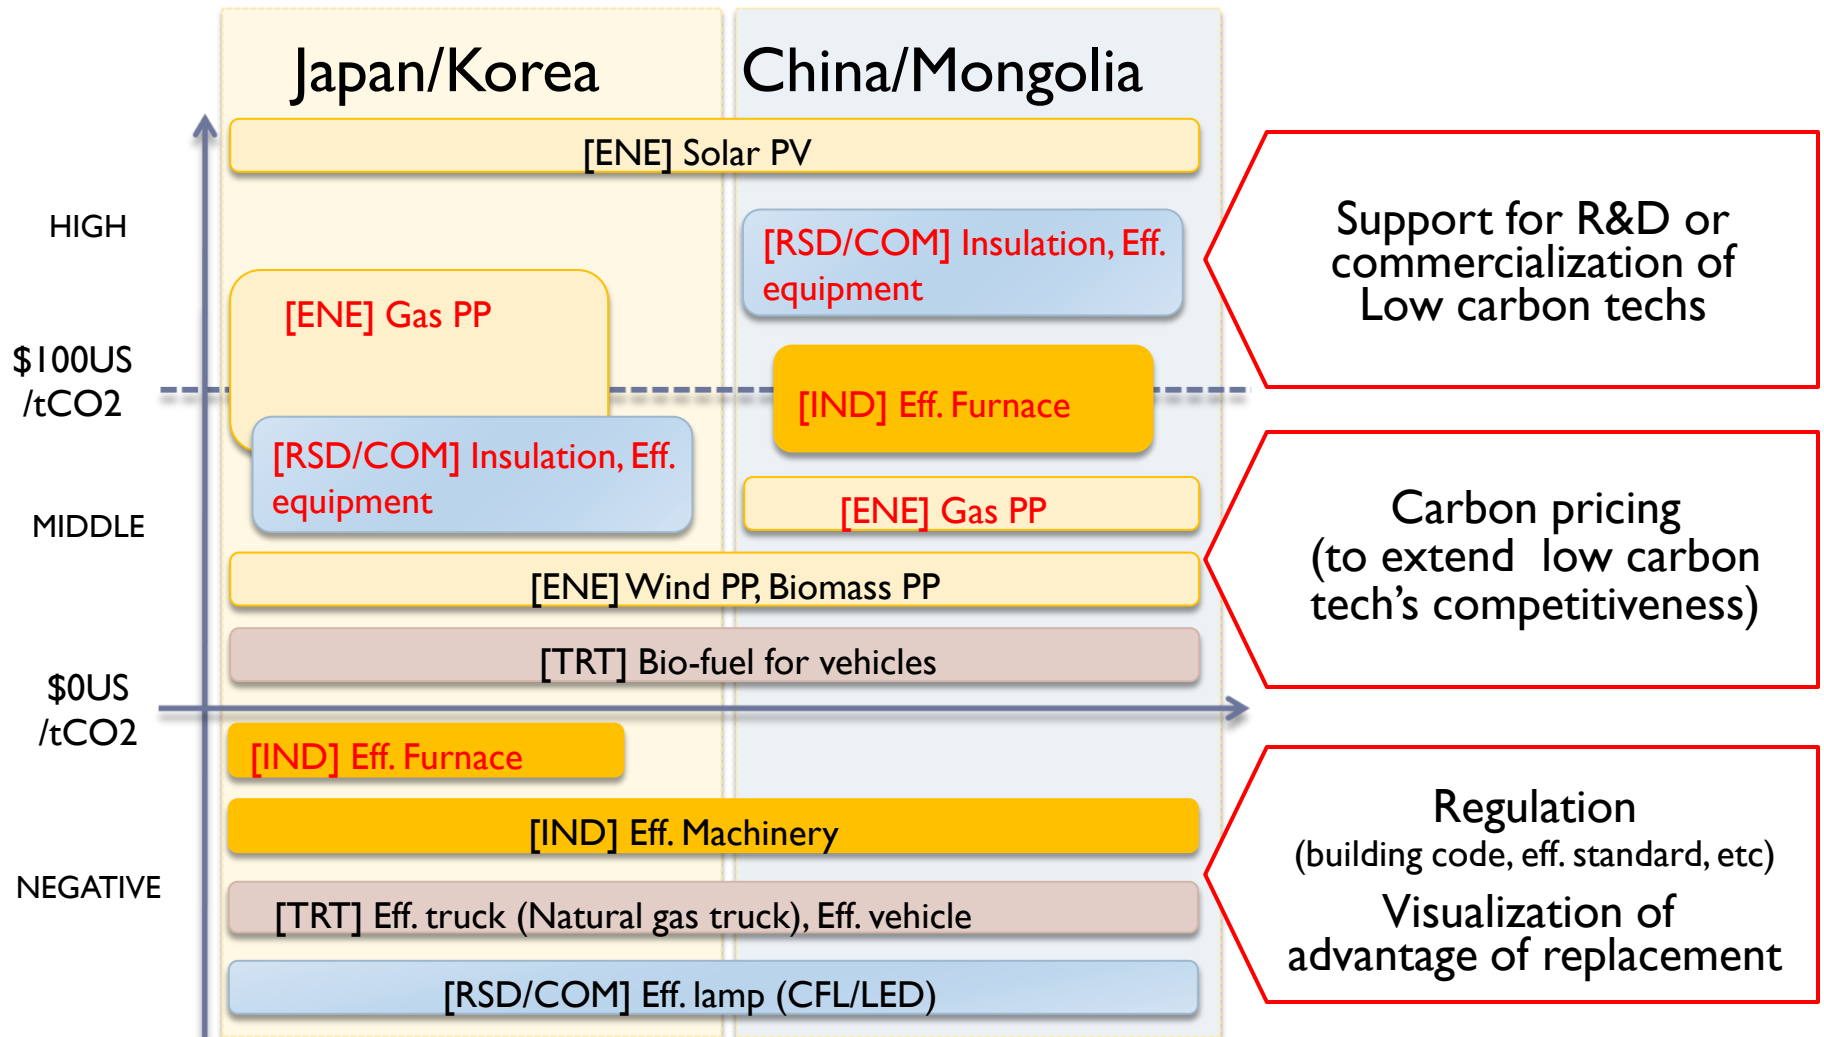

## (1) Effective policy varies for the type of technologies

- ▶ In following example, mitigation options are divided into three groups.
  - ▶ Technologies with very HIGH (100~) abatement cost
  - ▶ Technologies with MIDDLE (0 ~ 100) abatement cost
  - ▶ Technologies with NEGATIVE abatement cost

# Policy implications

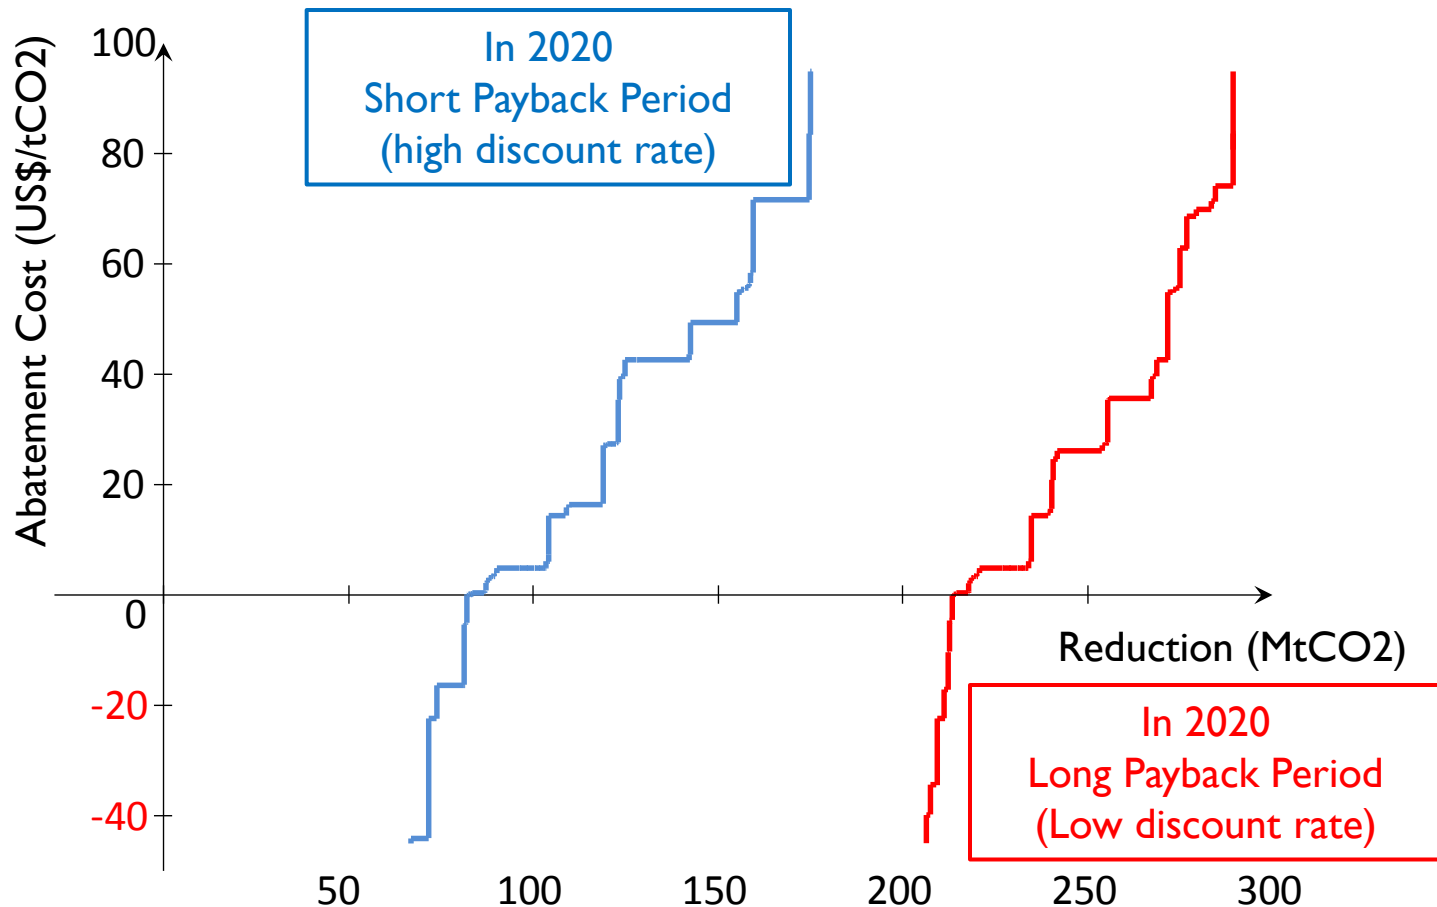

## (1) Effective policy varies for the type of technologies

# Policy implications

## (2) Payback period has a large impact

- ▶ There are major changes in reduction potential depending on the payback period in Japan.

# Policy implications

## (2) Payback period has a large impact

- ▶ Measures for extending payback period are required to make reduction larger.

# Policy implications

## (3) Measures for climate change and energy security

### ► Energy consumption structure in 2020/30 in China.

# Policy implications

## (3) Measures for climate change and energy security

---

- ▶ **Energy consumption structure in 2020/30 in China.**
  - ▶ Coal consumption in China would increase tremendously in the event that no mitigation options were introduced.
  - ▶ On the other hand, in the event that measures are taken, it was found that the increase from the base year could be held to a small amount.

**Measures for GHG emission reduction are thought to be an important policy from the standpoint of energy security as well.**

# Conclusion

---

- ▶ **Emission Projection, MAC curve**
  - ▶ Emission/mitigation in 2020/2030
  - ▶ Abatement cost curve
  
- ▶ **Policy Implications**
  - ▶ The effective policy will vary for technologies and countries.
  - ▶ Policy for extending payback period is crucial for Japan.
  - ▶ Actions for GHG emission reduction seem to be able to realize more stable energy security for China.

Thank you for your attention
