# Spatial explicit population/GDP scenario

# Population scenario

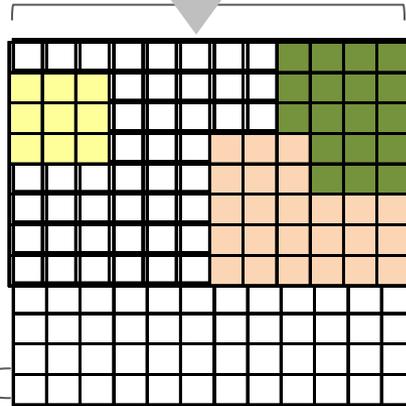

# Landuse downscaling model

## Geophysical constraint

- Built-up area < 5 degree
- Forest < 20 degree
- etc.

0.5 degree

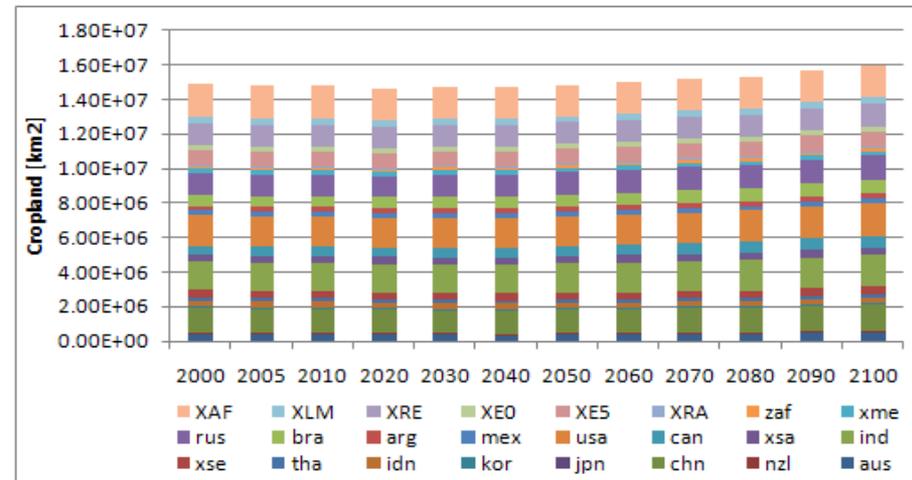

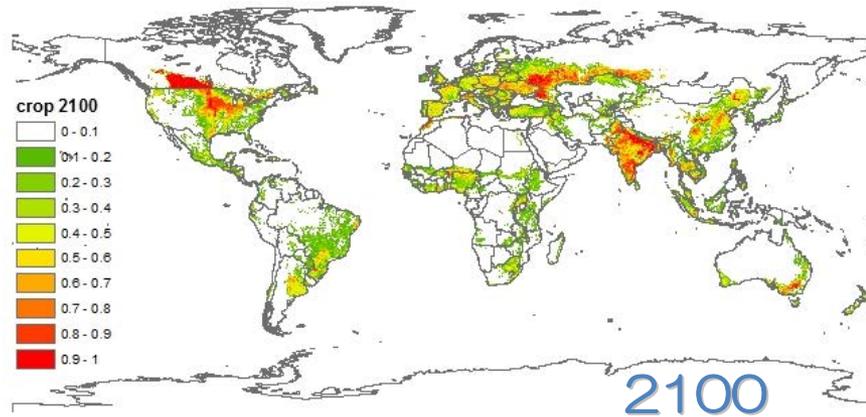

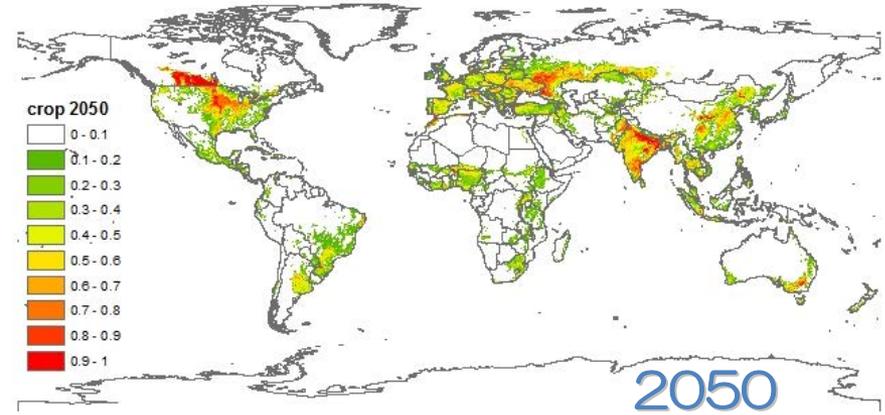

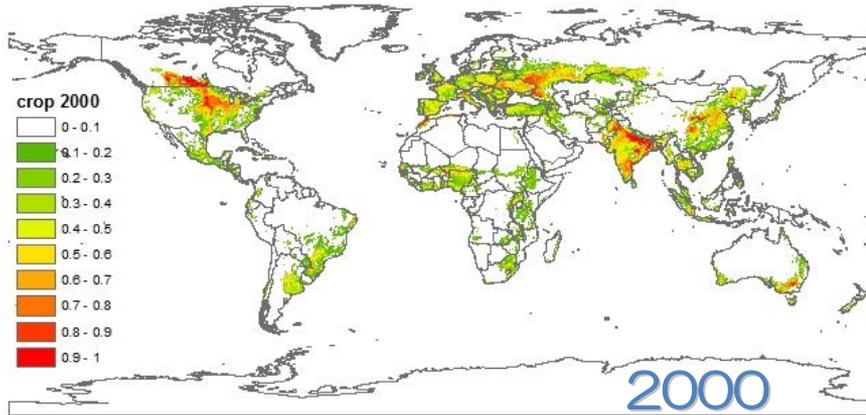

1km

1. Urban (GDP, crop price...)
2. Cropland (yield, slope angle...)
3. Pasture (NPP, slope angle...)
4. Harvest forest (population density..)

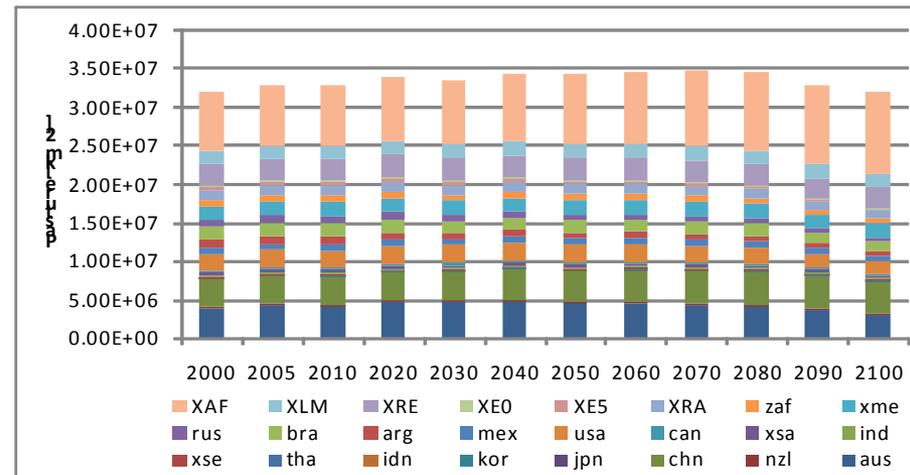

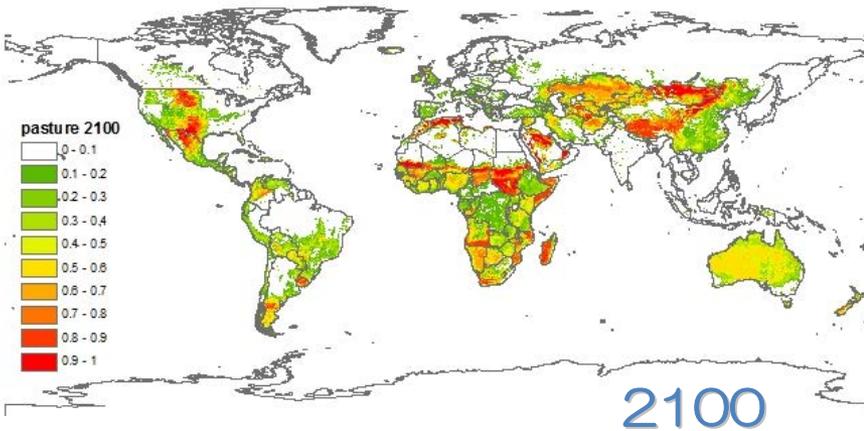

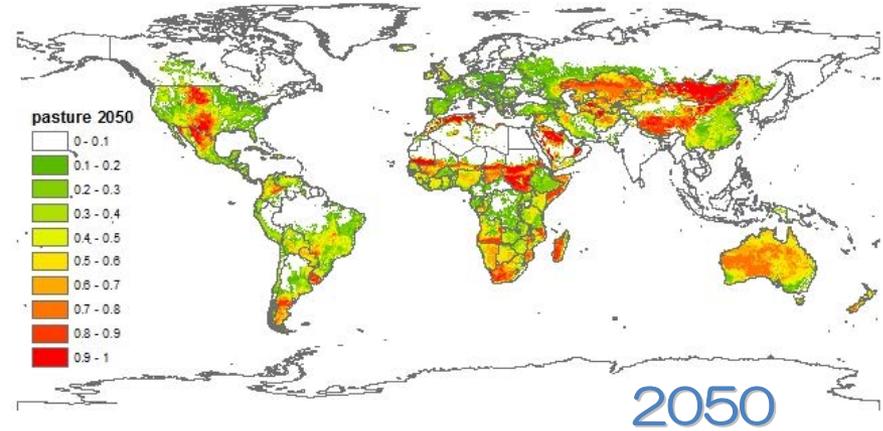

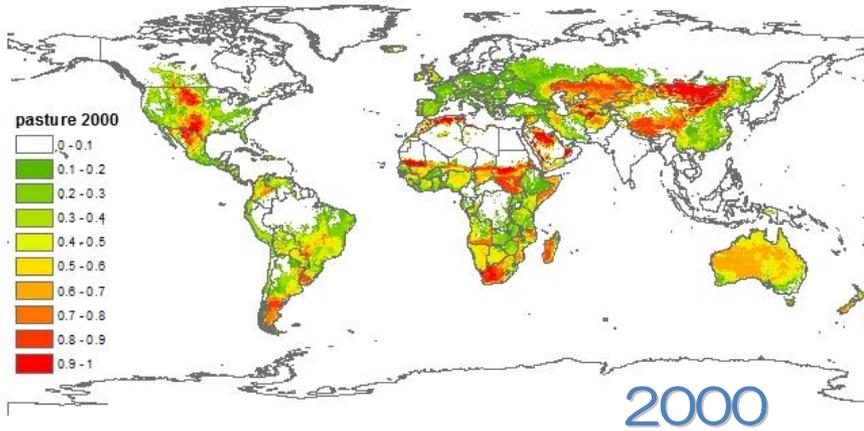

# Results (Land-use scenario)

## Cropland

# Results (Land-use scenario)

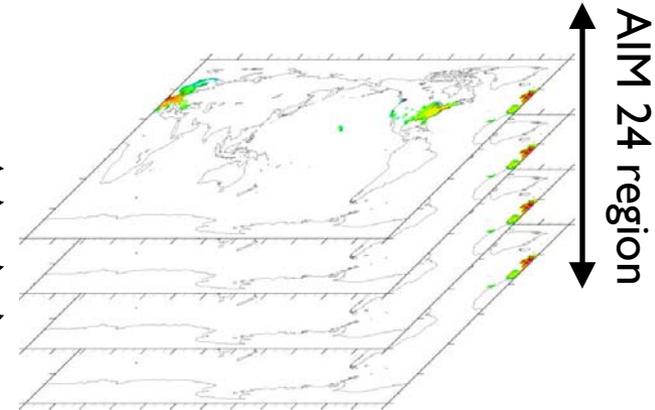

## Pasture

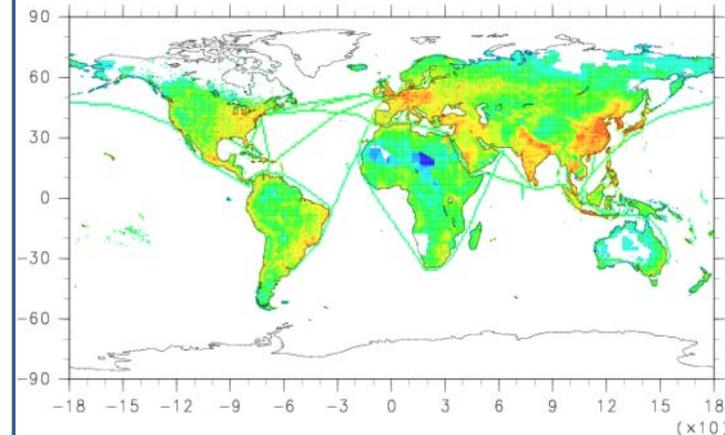

# Emission downscaling model

Sector	region	indicator for downscale
electricity	Japan	population
electricity	China	population
...	...	...
agriculture	USA	agricultural area
		...

From IAM

Summed up

Downscale by indicator

Global distribution

Regional distribution

- Power plant & energy conv. (by population)
- Industry: process & combustion (by GDP)
- Solvent use (by GDP)
- Residential & commercial (by rural pop)
- Waste (by population)
- Agriculture: waste (by agriculture)
- International shipping
- Aviation
- Transportation (road & railroad)
- Agriculture : Animal & Soil

# Case 1

Changes in regional emissions are downscaled according to spatially explicit indicators for each sector and each region.

ENE (total population), IND (GDP), SLV (GDP), DOM (rural population), WST (total population) & AWB (cropland area)

$$E_s(x, y, t) = E_s(x, y, t - \Delta t) + \sum_r \{e_{r,s}(t) - e_{r,s}(t - \Delta t)\} \times \frac{w_{r,s}(x, y, t)}{\iint w_{r,s}(x, y, t) dx dy}$$

$x$  : longitude     $y$  : latitude     $t$  : year     $r$  : region     $s$  : sector

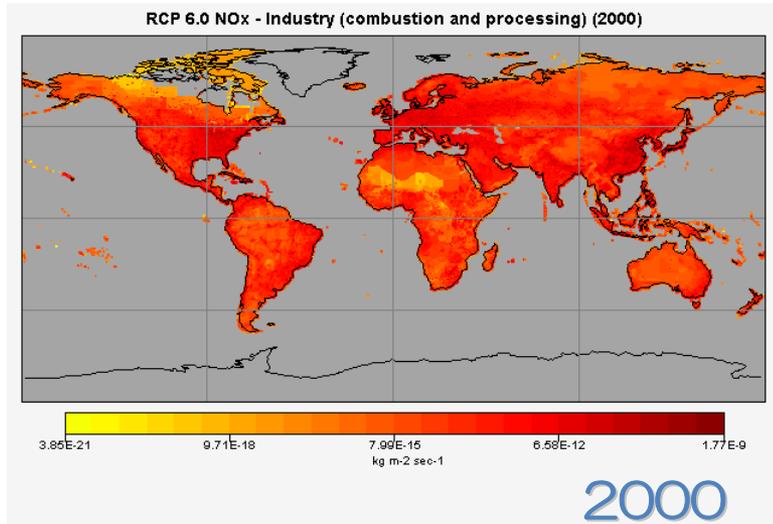

$E_s(x, y, t)$  : gridded emissions from a sector  $s$

$e_{r,s}(t)$  : regional emissions for region  $r$  and for sector  $s$  estimated by IAM

$w_{r,s}(x, y, t)$  : spatially explicit indicator for region  $r$  and for sector  $s$

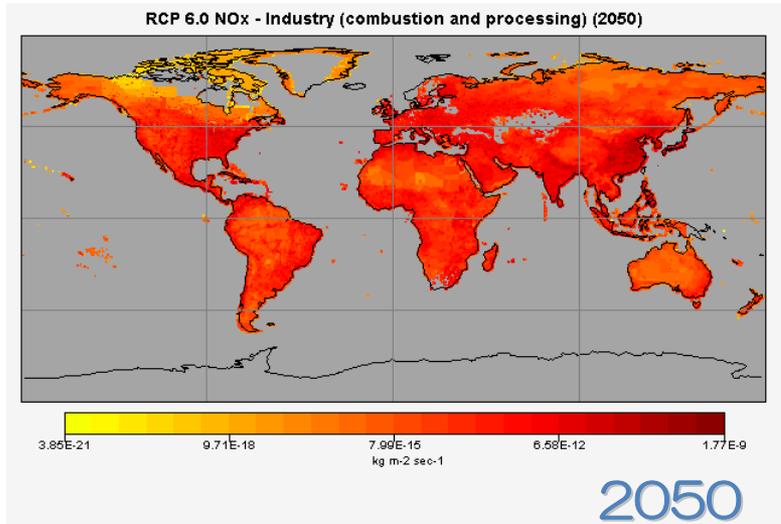

# Spatial explicit emission scenarios

## Case 1 (Industry, NO<sub>2</sub>)

# Case 2

Global distribution at year 2000 is scaled by world total emissions.  
SHP & AIR

$$E_s(x, y, t) = E_s(x, y, t_0) \times \frac{e_s(t)}{e_s(t_0)}$$

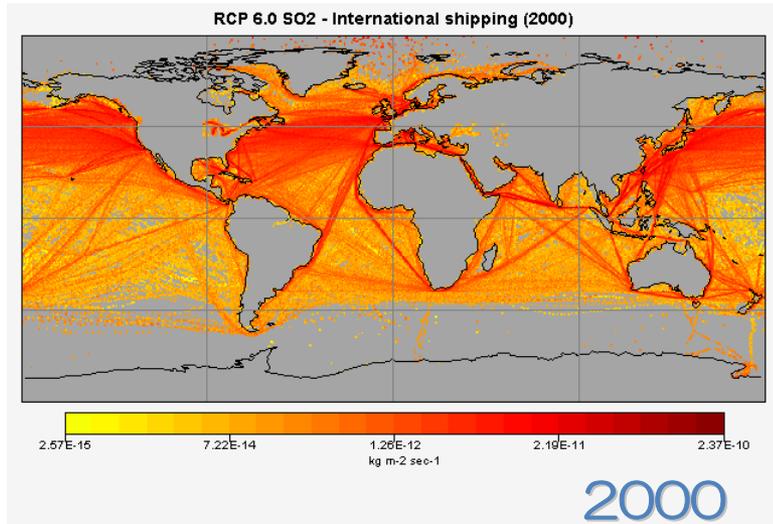

$x$  : longitude     $y$  : latitude     $t$  : year     $s$  : sector

$E_s(x, y, t)$  : gridded emissions from a sector  $s$

$e_s(t)$  : global emissions for sector  $s$  estimated by IAM

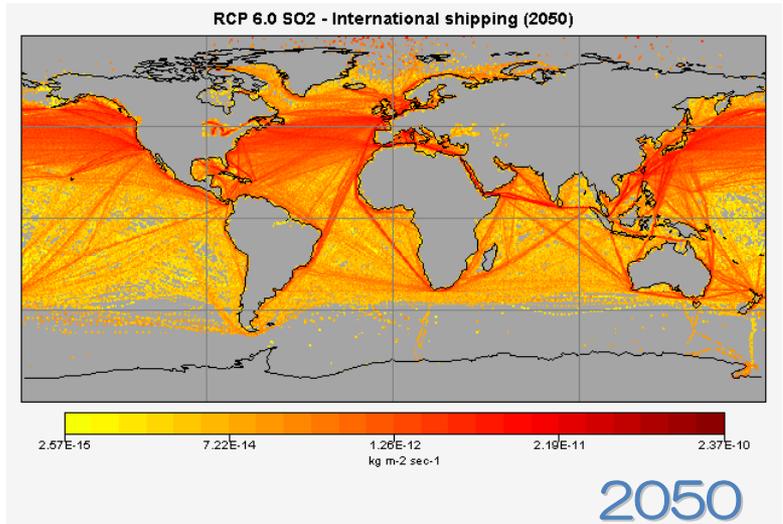

# Spatial explicit emission scenarios

## Case 2 (International shipping, SO<sub>2</sub>)

# Case 3

Regional distribution at year 2000 is scaled by regional total emissions for each region.

TRA & AGR

$$E_s(x, y, t) = \sum_r E_{r,s}(x, y, t_0) \times \frac{e_{r,s}(t)}{e_{r,s}(t_0)}$$

$x$  : longitude     $y$  : latitude     $t$  : year     $r$  : region     $s$  : sector

$E_s(x, y, t)$  : gridded emissions from a sector  $s$

$E_{r,s}(x, y, t)$  : gridded emissions region  $r$  and for sector  $s$

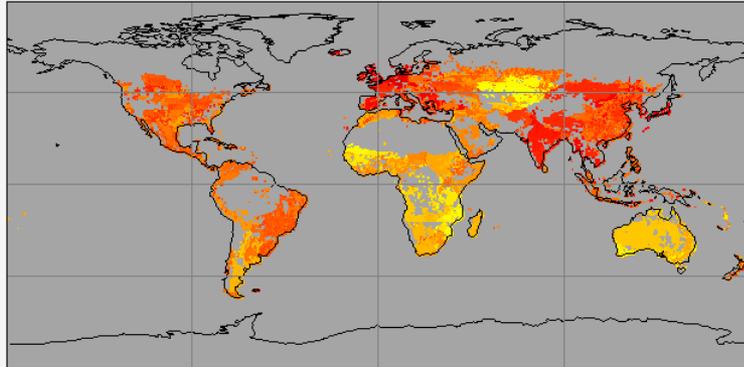

$e_{r,s}(t)$  : regional emissions for region  $r$  and for sector  $s$  estimated by IAM

$w_{r,s}(x, y, t)$  : spatially explicit indicator for region  $r$  and for sector  $s$

# Spatial explicit emission scenarios

## Case 3 (Agriculture, NH3)

RCP 6.0 NH3 - Agriculture (animals, rice, soil) (2000)

# Remaining works

- Emissions from landuse change are diverse among models.

- Extension to 2300.
