Life Cycle Assessment (LCA), Bottom-Up model (BU) and Computable General Equilibrium (CGE) model

LCA: Focused on <u>one product</u> and traces the environmental load occurred upstream and down stream in production / disposal. Good for calculating a <u>perturbation effect</u> of usage / preference change of the product

Usually <u>ignore the substitution effect</u> among production factors, intermediate goods for production. Focused on the <u>material chain cycle</u> of good's production and disposal.

BU: The <u>quantities to be produced /consumed are</u> <u>prescribed</u>. Calculates the effect of improvement of production technology, required amount of product and so on. The <u>reduction efforts of energies /</u> <u>products are not reflect to the prescribed quantities</u> to be produced

#### Life Cycle Assessment (LCA), Bottom-Up model (BU) and Computable General Equilibrium (CGE) model

- CGE: Focused on the <u>mutual interaction on economic</u> <u>sectors</u>, and calculate the interactive effects among technology improvement, change of consumer preference, economic policies.
- Focused on the <u>financial /economic chain cycle</u> of good's production and consumption

AIM/Material : Coupling of LCA and CGE strong-ness, the model describes environmental loads from the view point of material chain cycle and financial /economic chain cycle.

# **Energy and Material Chain Cycle**

produced commodity (goods and bads)

# LCA approach

produced commodity (goods and bads)

### **Bottom up approach**

### **AIM/Material**

produced commodity (goods and bads)

# Summary

approach	characteristics
LCA	Good for estimating the effect of one product introduction and retreat to/from society, effect of change of alternative production methods. Good for comparing environmental loads of a product with a same survice kind/amount
BU	Easy to apply regional/national environmental policy, easy to have consistency with economic plans. Easy to calculate the effect of detailed energy technology improvement
AIM/Material	Good at to estimate social costs and social benefits and mutual interaction of environmental and economic policies, clearly taken account of price change effects
